199.1.1515 TicketNoteWebhooksByParentIdExcludedResourcesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketNoteWebhooksByParentIdExcludedResourcesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1535 TicketsByParentIdAdditionalConfigurationItemsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketsByParentIdAdditionalConfigurationItemsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `TicketsByParentIdAdditionalContactsEntityInformation_FieldsPicklistValuesUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketsByParentIdChargesEntityInformationUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function TicketsByParentIdSecondaryResourcesEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

199.1.1610 TicketWebhooksByParentIdExcludedResourcesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `TicketWebhooksByParentIdExcludedResourcesEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1613 TicketWebhooksByParentIdExcludedResourcesEntityInformationFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketWebhooksByParentIdExcludedResourcesEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1658 UserDefinedFieldsByParentIdListItemsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function UserDefinedFieldsByParentIdListItemsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `UserDefinedFieldsByParentIdListItemsEntityInformationUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `UserDefinedFieldsByParentIdListItemsEntityInformationUserDefinedFields` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

203.1.2 NotificationHistoryById

Catalog: Autotask

Schema: NotificationHistory

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function NotificationHistoryById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int64	<input checked="" type="checkbox"/>

204.1.3 OpportunitiesById

Catalog: Autotask

Schema: Opportunities

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function OpportunitiesByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

208.1.2 OrganizationalLevel2sByld

Catalog: Autotask

Schema: OrganizationalLevel2

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function OrganizationalLevel2sByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int64	<input checked="" type="checkbox"/>

216.1.2 PriceListProductsById

Catalog: Autotask

Schema: PriceListProducts

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PriceListProductsByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

224.1.3 ProductsById

Catalog: Autotask

Schema: Products

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProductsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

229.1.2 ProjectAttachmentsById

Catalog: Autotask

Schema: ProjectAttachments

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectAttachmentsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

233.1.2 ProjectNoteAttachmentsById

Catalog: Autotask

Schema: ProjectNoteAttachments

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectNoteAttachmentsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

237.1.3 ProjectsById

Catalog: Autotask

Schema: Projects

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

243.1.2 PurchaseOrdersById

Catalog: Autotask

Schema: PurchaseOrders

This is a read-only table function. The Autotask API may not support changing the data or the Inventive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrdersByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

247.1.2 QuotesByld

Catalog: Autotask

Schema: Quotes

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function QuotesByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ResourcesByParentIdRoleDepartments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function ResourceServiceDeskRolesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

264.1.2 SalesOrdersByParentIdAttachmentsId

Catalog: Autotask

Schema: SalesOrderAttachmentsChild

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrdersByParentIdAttachmentsId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

268.1.2 ServiceBundleServicesById

Catalog: Autotask

Schema: ServiceBundleServices

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServiceBundleServicesByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Catalog: Autotask

Schema: ServiceCallTasksChild

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServiceCallsByParentIdTaskId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

281.1.2 ServicesById

Catalog: Autotask

Schema: Services

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServicesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

295.1.2 TaskNoteAttachmentsById

Catalog: Autotask

Schema: TaskNoteAttachments

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TaskNoteAttachmentsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TasksByParentIdPredecessors. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

303.1.2 TaskSecondaryResourcesById

Catalog: Autotask

Schema: TaskSecondaryResources

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TaskSecondaryResourcesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

311.1.2 TicketAdditionalContactsById

Catalog: Autotask

Schema: TicketAdditionalContacts

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketAdditionalContactsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Catalog: Autotask

Schema: TicketCategoryFieldDefaultsChild

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketCategoriesByParentIdFieldDefaults. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

322.1.2 TicketChecklistItemsById

Catalog: Autotask

Schema: TicketChecklistItems

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketChecklistItemsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

327.1.2 TicketNotesByld

Catalog: Autotask

Schema: TicketNotes

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketNotesByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

333.1.2 TicketNoteWebhooksById

Catalog: Autotask

Schema: TicketNoteWebhooks

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketNoteWebhooksById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

336.1.3 TicketsByld

Catalog: Autotask

Schema: Tickets

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketsByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

337.1.2 TicketSecondaryResourcesById

Catalog: Autotask

Schema: TicketSecondaryResources

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketSecondaryResourcesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

343.1.2 TicketWebhookFieldsById

Catalog: Autotask

Schema: TicketWebhookFields

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketWebhookFieldsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

349.1.2 TimeEntryAttachmentsByld

Catalog: Autotask

Schema: TimeEntryAttachments

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TimeEntryAttachmentsByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

 Is Approved 2005, 2202, 2203, 2204, 2205
 Is Assigned to Co-managed 2247, 2250, 2253
 Is Associated as Co-managed 135, 136, 137, 138
 Is Billable to Company 70, 71, 272, 273, 275, 277, 428, 429, 432, 433, 1981, 1982, 1984, 1986, 2206, 2208, 2210, 2212
 Is Billed 70, 71, 272, 273, 275, 277, 1981, 1982, 1984, 1986, 2206, 2208, 2210, 2212
 Is Client Portal Active 82, 83, 86, 88, 90
 Is Client Portal Default 170
 Is Complete 2090, 2091
 Is Completed 2214, 2216, 2217
 Is Compliant 329, 330, 331
 Is Compounded 2177
 Is Daily Pro-ration Enabled 256, 257, 259, 261
 Is Default 454, 456, 458, 467, 1970, 1971, 1972, 1973, 2041, 2042, 2044, 2045, 2057, 2058, 2059, 2060
 Is Default Contract 329, 330, 331
 Is Default Country 358

2240, 2269, 2270, 2271, 2273, 2276, 2277, 2278, 2279
Is Eligible for RMA 1962, 1963, 1964
Is Enabled for Co-managed 86, 88, 90
Is Encrypted 2295, 2296
Is Excluded from Automatic Tagging 2136, 2137
Is Excluded from New Contracts 61, 62, 2066, 2067
Is Field Mapping 2295, 2296
Is First Response Met 2109, 2110, 2112, 2113
Is Global Default 103, 104, 170, 2195, 2196
Is Important 76, 77, 78, 79, 377, 379, 380, 2214,
2216, 2217
Is Initial Payment 298, 299, 300, 302
Is Internal Currency 359, 360
Is Internal Notes Visible to Co-managed 2280, 2282
Is Non-billable 2280, 2282
Is Opted Out from Bulk Email 105, 107, 109, 235,
237, 239
Is Optional 2020, 2022, 2024, 2026
Is Paid 267, 269, 270, 319, 320, 321, 323, 352,
353, 355, 356

Is Picklist 495, 496, 497, 499, 500, 501, 502, 503
Is Primary 111, 112, 114, 116
Is Primary Co-managed Resource 84, 85
Is Private 2295, 2296
Is Protected 2295, 2296
