199.1.451 ContractExclusionSetsByParentIdExcludedRolesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractExclusionSetsByParentIdExcludedRolesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractExclusionSetsByParentIdExcludedWorkTypesEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.494 ContractsByParentIdBillingRulesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ContractsByParentIdBillingRulesEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.496**ContractsByParentIdBillingRulesEntityInformation_FieldsPicklistValuesUserDefinedFields**

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractsByParentIdBillingRulesEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.508 ContractsByParentIdBlocksEntityInformationUserDefinedFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ContractsByParentIdBlocksEntityInformationUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.520 ContractsByParentIdExclusionRolesEntityInformation_FieldsPicklistValuesFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractsByParentIdExclusionRolesEntityInformation_FieldsPicklistValuesFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.532 ContractsByParentIdNotesEntityInformationFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractsByParentIdNotesEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function ContractsByParentIdRoleCostsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ContractsByParentIdServiceBundleAdjustmentsEntityInformation_FieldsPicklistValuesUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function `ContractsByParentIdServiceBundleUnitsEntityInformationUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.581**ContractsByParentIdTicketPurchasesEntityInformation_FieldsPicklistValuesUserDefinedFields**

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractsByParentIdTicketPurchasesEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.657 DocumentCategoriesByParentIdDocumentsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentCategoriesByParentIdDocumentsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `DocumentCategoriesByParentIdDocumentsEntityInformation` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
<code>info_canCreate</code>	boolean	Can Create	<input type="checkbox"/>

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `DocumentCategoriesByParentIdDocumentsEntityInformation_FieldsPicklistValuesFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.697 DocumentsByParentIdArticleAssociationsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentsByParentIdArticleAssociationsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

DocumentsByParentIdChecklistLibrariesEntityInformation_FieldsPicklistValuesUserDefinedFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentsByParentIdChecklistLibrariesEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.722 DocumentsByParentIdDocumentAssociationsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentsByParentIdDocumentAssociationsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.734**DocumentsByParentIdPlainTextContentEntityInformation_FieldsPicklistValuesUserDefinedFields**

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentsByParentIdPlainTextContentEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DocumentsByParentIdTicketAssociationsEntityInformationUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function DocumentsByParentIdTicketAssociationsEntityInformationUserDefinedFields are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
defaultValue	string	Default Value	<input type="checkbox"/>	
description	string	Description	<input type="checkbox"/>	
isPickList	boolean	Is Picklist	<input type="checkbox"/>	
isQueryable	boolean	Is Queryable	<input type="checkbox"/>	
isReadOnly	boolean	Is Read-only	<input type="checkbox"/>	
isReference	boolean	Is Reference	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
isRequired	boolean	Is Required	<input type="checkbox"/>	
isSupportedWebhookField	string		<input type="checkbox"/>	
label	string	Label	<input type="checkbox"/>	
length	int32	Length	<input type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	
picklistParentValueField	string	Pick List Parent Value Field	<input type="checkbox"/>	
referenceEntityType	string	Reference Entity Type	<input type="checkbox"/>	
type	string	Type	<input type="checkbox"/>

199.1.793 ExpensesByParentIdItemsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ExpensesByParentIdItemsEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

The following parameters can be used to control the behaviour of the table function HolidaySetsByParentIdHolidaysEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

199.1.833 InventoryItemsByParentIdSerialNumbersEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryItemsByParentIdSerialNumbersEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.853 InventoryProductsByParentIdStockedItemsAddEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryProductsByParentIdStockedItemsAddEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

The following parameters can be used to control the behaviour of the table function `InventoryProductsByParentIdStockedItemsAddEntityInformation_FieldsPicklistValuesUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `InventoryProductsByParentIdStockedItemsRemoveEntityInformationUserDefinedFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function KnowledgeBaseArticlesByParentIdArticleAssociationsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

KnowledgeBaseArticlesByParentIdPlainTextContentEntityInformation_FieldsPicklistValuesUserDefinedFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function KnowledgeBaseArticlesByParentIdPlainTextContentEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function KnowledgeBaseCategoriesByParentIdKnowledgeBaseArticlesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.968 OpportunitiesByParentIdSalesOrdersEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function OpportunitiesByParentIdSalesOrdersEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.991 OrganizationalLevelAssociationsByParentIdResourcesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function OrganizationalLevelAssociationsByParentIdResourcesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.1056 ProductsByParentIdNotesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProductsByParentIdNotesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1102 ProjectsByParentIdChargesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ProjectsByParentIdChargesEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1110 ProjectsByParentIdNotesEntityInformationFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectsByParentIdNotesEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1137 PurchaseOrderItemsByParentIdReceivingEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `PurchaseOrderItemsByParentIdReceivingEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1140 PurchaseOrderItemsByParentIdReceivingEntityInformationFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderItemsByParentIdReceivingEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1167 QuotesByParentIdItemsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function QuotesByParentIdItemsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ResourcesByParentIdRoleDepartmentsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1207**ResourcesByParentIdRoleQueuesEntityInformation_FieldsPicklistValuesUserDefinedFields**

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ResourcesByParentIdRoleQueuesEntityInformation_FieldsPicklistValuesUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ResourcesByParentIdServiceDeskRolesEntityInformationUserDefinedFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1258 ServiceBundlesByParentIdServicesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ServiceBundlesByParentIdServicesEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1273 ServiceCallsByParentIdTasksEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServiceCallsByParentIdTasksEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.1293 ServiceCallTasksByParentIdResourcesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ServiceCallTasksByParentIdResourcesEntityInformation`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1308 ServiceCallTicketsByParentIdResourcesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServiceCallTicketsByParentIdResourcesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1323 ServiceLevelAgreementsByParentIdResultsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ServiceLevelAgreementsByParentIdResultsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentid	string	<input checked="" type="checkbox"/>

199.1.1348 SubscriptionsByParentIdPeriodsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SubscriptionsByParentIdPeriodsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SubscriptionsByParentIdPeriodsEntityInformationFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `SubscriptionsByParentIdPeriodsEntityInformationFields` are shown below. Each column has an SQL data type.

199.1.1378 TagsByParentIdAliasesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TagsByParentIdAliasesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

199.1.1404 TasksByParentIdNotesEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TasksByParentIdNotesEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
parentId	string	<input checked="" type="checkbox"/>

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

199.1.1407 TasksByParentIdNotesEntityInformationFields

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `TasksByParentIdNotesEntityInformationFields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.1457 TicketCategoriesByParentIdFieldDefaultsEntityInformation

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invariantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketCategoriesByParentIdFieldDefaultsEntityInformation. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

199.1.1458**TicketCategoriesByParentIdFieldDefaultsEntityInformation_FieldsPicklistValuesFields**

Catalog: Autotask

Schema: Metadata

This is a read-only table function. The Autotask API may not support changing the data or the Invantive UniversalSQL driver for Autotask does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Autotask API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function TicketCategoriesByParentIdFieldDefaultsEntityInformation_FieldsPicklistValuesFields. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.
