1 Invantive Composition for Word

Many organizations experience problems with the optimization of the information flow. An often occurring problem is the composition of complex documents with data from a database or application. Because of the multitude of complex information and deviating rules per jurisdiction employees spend a lot of time in the composing of documents. This manual and repetitive activity causes more erroneously composed documents and brings with it unnecessary employee costs. For organizations that are dealing with different laws and regulations such as insurers, lawyers and health care institutions, the creation of complex documents is a costly and time consuming task. The automatic generation and creation of documents that meet the laws and regulations is a huge challenge for most.

Invantive Composition for Word offers a complete solution for automatically generating complex documents that meet the requirements of laws and regulations. Invantive Composition allows you to easily retrieve information from your database and process it in Microsoft Word. This way, Invantive Composition makes it easy for you to automatically populate previously created templates with data from your database. For you this means that you can merge data from your administration system such as budget consumption, contract pieces, licenses, prices and other structured data into a personal document. The advantage of this is that with Invantive Composition you can manage and dynamically create documents from the document management system. Which results in an optimized information and communication process.

1.1 Snelle Configuratie

If you follow these steps, you will be able to start working with Invantive Composition for Word quickly.

Perform the following steps:

- Check if the drivers have been installed on your workplace so the database can be accessed. For Microsoft SQL Server, drivers are always present. For other database platforms you can find an explanation of the installation process here.

- If a connection is required from multiple workplaces, it is advisable to use the Invantive Web Service, because that means the drivers won’t have to be installed at all workplaces.

- Double-click on the file setup.exe.

- Klik on Install when the following screen is displayed:
• The installation will be performed.

• Invantive Composition for Word will be started at the same time as Microsoft Word. This means you can only start the program by starting Microsoft Word.

• When Microsoft Word is opened the first time after the installation, the configuration screen is displayed. The configuration screen is also displayed when Ctrl is pressed during the start-up process of Microsoft Word.
- Start Notepad via the Windows Start menu.

- Create an empty file called settings.xml and save it on your desktop.

- The folder from which you have installed Invantive Composition for Word contains an example of a settings.xml file with an additional explanation. An example for Microsoft SQL Server can also be found on http://www.invantive.com/about-invantive/news/entryid/1123/windows-authenticatie-met-sql-server-voor-invantive-settings-xml. An example for Oracle can also be found on http://www.invantive.com/about-invantive/news/entryid/1124/oracle-rdbms-met-invantive-settings-xml.

- In the settings.xml file you define the database connections you want to use.

- If you need help with this, you can call Invantive Support for free at +31 88 00 26 599, you can call support@invantive.com or visit http://support.invantive.com.

- Choose your settings.xml file in the configuration screen.

- Press OK.

- The login screen is now displayed.
Select the connection you want to use.
Enter the username.
Enter the password.
Click on 'Connect'.
The login screen is closed. The buttons that correspond with your rights are displayed in the ribbons Invantive Composition and Modelling.
• **Getting started** will show you how you can start working with Invantive Composition for Word.

1.2 Aan de slag

Here you learn how you can get started with Invantive Composition for Word quickly.

After the **Quick Configuration**, Microsoft Word is opened.

There are no further instructions.

1.3 Werking

The image displays the global working of Invantive Composition. The developer of the template develops the template and an accompanying model in Invantive Composition and saves it as a Word or Powerpoint file. This can be stored in Invantive Estate, Invantive Vision or a different Invantive Producer-based application. The developer of the template can also save the template on the file system, in a folder of the Invantive Web Service or in a Document Management System such as SharePoint or IBM ECM.

The user of the template subsequently opens the template and combines the template with data from the database. The final result is a Word or PowerPoint document with pre-filled data from the database. Overmore, Invantive Composition can, at once, enter the document properties properly by means of a case number or project code.

The user checks the document and, if needed, adds information. After that, the user can archive the document in a DMS or on a drive, for example as a Word or PowerPoint file or as an Adobe PDF file.
1.4 Voordelen

The automation of your information flow with Invantive Composition will bring you advantages such as:

- Optimization of the documenting and communication process.
- Automatically fill previously created templates in Word with data and tables.
- Focus on your business operations, not on the technology, without programming and without software developers.
- Lower time-to-market for the editing of your business operations by decreasing the efforts of your IT department.
- Add unstructured texts in a document together with structured data from your databases, datawarehouses and applications.
- Open documents from Word that were stored in a database, document management system or the file system.
- Less of erroneously prepared documents and lower costs per document.
- Improved security of company information.

With Invantive Composition you will have a complete solution for the automatic generation of complex documents in Microsoft Word. Invantive Composition easily allows you to automatically retrieve and edit unstructured data from a database or application. By automatically
filling precomposed templates with data, you will easily compose complex documents that meet the laws and regulations. This way Invantive Composition optimizes your information flow and yields you a cost reduction. By default, Invantive Composition is supplied along with Invantive Vision and Invantive Estate.

### 1.5 Systeemeisen

To use Invantive Composition on your PC or terminal server you will need the following software including licenses:

- Microsoft Word 2010 or Microsoft Word 2013 (only on Microsoft Windows).
- Microsoft .NET 4.5.
- Minimum 2 GB of internal memory.
- Microsoft Windows 7, 8 or 8.1.
- Screen resolution of 1280 x 1024 or higher.
- User license for databases used and/or business applications.
- Invantive Web Service or local drivers.

Use on Mac, tablet or smartphone is not possible.

### 1.6 Installatie

Invantive Composition is installed on the Windows computers by executing the following steps:

- Run the installation file 'setup.exe' then click on the 'Install' button. The file is in the folder of Invantive Composition for Word and in the folder of Invantive Composition for PowerPoint. You need to do a separate installation for every product. These installation folders are supplied by Invantive.

![Microsoft Office Customization Installer](image)

- When the installation is finished, the screen below is displayed.
Then you start Microsoft Word or Microsoft PowerPoint to use Invantive Composition. After launching the Office program this screen is displayed. In this screen, you need to enter the location of the connection file. See Connection configuration for the explanation of the connection file. Then click on 'OK' to save the change.

1.7 Gebruik

This paragraph displays an explanation the tab Invantive Composition in the ribbon in Microsoft Word and PowerPoint. The user can open templates, set values to parameters and complete a document. The following image displays the bar Invantive Composition
Depending on your rights, a part of the buttons may not be visible. Depending on the chosen configuration it may be required to first connect before all buttons become visible.

1.7.1 Open Sjabloon

The group 'Document Management' includes a 'Open Template'. With this you will open a screen to open documents with from a supported DMS in Invantive Composition. You can of course also open documents in your file system. The advantage of a central DMS is that everyone always has the correct versions, independent of whether the user has access to the disks on his work.

In this screen you will see template documents dependent on your rights. Select the desired template.

Once you have chosen the template, then it will be published immediately. Read more in Publishing.
1.7.2 Document Archiveren

With 'Archive Document' you open a window to save a published document in any supported DMS directly from within Invantive Composition. You can also save documents in the file system. The advantage of a central DMS is that everyone has fast and secure access to documents.

In this window, you fill in the Details tab and the Properties meta-data of the document:

Then click on 'Archive Document' and the document will be archived.

1.7.3 Publiceren

The publishing combines the template with data from the database so that you receive a pre-filled document.

If there are no parameters, then there is nothing else that needs to be done. If there are parameters, then Invantive Composition first asks which values you wish to use, such as for example:

If possible the values will immediately be filled with a useful value. Parameter can be supplied with a button. If you choose this button, then you will get a list with possible values. An example of a list with possible values:
1.7.4 Parameterwaardes

The standard parameter values that you enter in Publishing can also be requested using this button and other values can be provided.
1.7.5 Verbinden

Click on the tab Invantive Composition in the ribbon and subsequently click on the button 'Connect' to connect to the server. Enter user name, password and connection and click on 'OK'.
The meaning of the entry fields is:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>The username used for connecting to the server.</td>
</tr>
<tr>
<td>Password</td>
<td>The password of the user.</td>
</tr>
<tr>
<td>Connection</td>
<td>Here you enter the server with which you want to connect.</td>
</tr>
<tr>
<td>Remember password</td>
<td>The password will be stored encrypted, when checked.</td>
</tr>
<tr>
<td>Automatically connect</td>
<td>The application automatically connects to the server and the connection screen does not appear, when checked.</td>
</tr>
</tbody>
</table>

1.7.6 Voorkeuren

With this button on the screen for preferences:

In this screen you can set the preferences for Invantive Composition and other Invantive Producer-based products.
The meaning of the fields in the tab Filter is:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your name</td>
<td>The name of the user within Invantive Producer.</td>
</tr>
<tr>
<td>Report date</td>
<td>Here you can enter the reporting date for which the information on the reports should be shown. This data is activated when checked.</td>
</tr>
</tbody>
</table>
The significance of the field in the Preferences tab:

| Language | This lists the languages that are available in Invantive Composition. The language shift is immediately processed after closing the screen. |
The meaning of the field in the tab Statistics is:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First login date</td>
<td>The time on which you logged in successfully for the first time.</td>
</tr>
<tr>
<td>Last login date</td>
<td>The time on which you login successfully for the last time.</td>
</tr>
<tr>
<td>Last failed login try</td>
<td>The time on which someone with your login code failed to login for the last time.</td>
</tr>
<tr>
<td>Number of Consecutive Failed Logins</td>
<td>The number of subsequent login attempts that have failed.</td>
</tr>
</tbody>
</table>
1.7.7 Help
The button 'Help' displays the help function of Invantive Composition.

1.8 Modeller
A template consists of pieces of text with in the middle instructions for Invantive Composition.

For the development of a template for Invantive Composition you use instructions in the text and data in a model. For the development you use the resources in the lint "Model":

1.8.1 Ontwerpmodus
The button 'Design Mode' is used to switch between the usage and the designing of a template with model.

If the design mode is disabled, then the button looks as follows:
By clicking on it you activate the design mode. If you have not yet entered the password of the model for this model during this session in Word, you need to do this first. If the design mode is enabled, then the button looks as follows:

1.8.2 Model Bewerken

The model of the template can be edited through the model editor. The model editor has a tree structure with various components.

1.8.3 Valideer Model

With this you validate the consistency and validity of the model, should errors have emerged in the structure due to manual changes.

1.8.4 Installeer Model

With the button 'Install model' you can transfer an existing Microsoft Word document to an Invantive Composition template. Invantive Composition adds a local repository with included the definition of a model. The model can be edited like described in Model Bewerken.

1.8.5 Upgrade Model

With the button 'Upgrade model' you update an existing model to the format that belongs with the version of Invantive Composition that you use. It is only possible to use newer versions. You can no longer use a model that has been updated to a newer version on an older version of Invantive Composition.

1.8.6 Verwijder Model

With the button 'Remove model' you transfer an Invantive Composition template into a Microsoft Word document. All data that is associated with Invantive Composition is removed like the repository.
1.8.7 Bouwblok

With the button 'Building Block' you can add an instruction on the current location of the cursor in the Invantive Composition template. In the list is listed first the blocks, subsequently the parameters and finally the environment variables. Blocks also have a menu of their own. In the menu of a block there is listed first a building block for the insertion of a `<invantive:foreach>` and subsequently the variable values.

1.8.8 Query Tool

With 'Query Tool' you start the Query Tool of Invantive from within Microsoft Word. You are logged in to Invantive Query Tool under the user that you are logged in for Invantive Composition.

1.8.9 Invantive Studio

With 'Invantive Studios you start from within Microsoft Word the CASE tool from Invantive: Invantive Studio. You are logged into Invantive Studio under the user with which you are also logged into Invantive Composition.

1.8.10 Toon Repository

The model of an Invantive Composition template is stored in a repository in the Microsoft Word document. With the button 'Show Repository' you will make the content of this repository visible:
Invantive Support could ask you in the case of malfunctions to edit parts of the repository and/or to send the repository.

1.8.11 Toon Spoor

'Show Trace' can be used to analyze any possible problems in the use of Invantive Composition. An extra screen appears if Show Trace is activated. In this screen notifications of Invantive Control are displayed, including the executed SQL statements. You can shut down 'Show Trace' by closing the new screen.

Invantive Support can ask to switch on 'Show Trace' and send the texts to help you analyze the problems.
1.8.12 Mogelijke instructies

The following types of instructions are possible:

- `<invantive:value-of/>`: Print value of an expression or cell from a SQL statement.
- `<invantive:foreach>...</invantive:foreach>`: Run through all rows of a SQL statement for the intermediate piece of text.

1.8.13 Expressies

An expression can use multiple types of data:

- Parameter value: the value that the user has entered for a parameter as described in the model.
- Variable value: the value of a cell out of a SQL statement.
- Group value: a derivative value of a cell from a SQL statement.
- Environment variables: the value of information concerning the environment.
- Resource variable: the translation of a translateable resource in the currently chosen language.
- Text: all the remaining.

1.8.14 `<invantive:value-of/>`

With `<invantive:value-of/>` you can request the value of an expression. This instruction can be added easily with Building Block.[13]

Several examples of `<invantive:value-of/>`:
Layout Parameters

The layout of the expression can be influenced with the following parameter:

- casing: use capitalization.

Use Casing

With "casing" you can change the capitalization of an expression. This can be used to display the same fields with capitals in parts of the document and in other places with lower case. Of course you can also do this by adjusting the SQL query.

The possible values of casing are:

- "Normal": replace nothing to the letters. For instance <invantive:value-of expression="$E{database:user}" casing="Normal"/> returns the database user name without changing characters.

- "LowerCase": replace all characters by the corresponding lowercase character. For instance <invantive:value-of expression="$E{database:user}" casing="UpperCase"/> returns the database user name in uppercase characters.

- "UpperCase": replace all letters by the associated upper case. For instance <invantive:value-of expression="$E{database:user}" casing="LowerCase"/> returns the database user name in lower case characters.

- "InitCaps": replace the first letter of every word by an upper case letter and replace the rest with lower case letters. For instance <invantive:value-of expression="$E{database:user}" casing="InitCaps"/> returns the database user name with all characters as lowercase; only the first character of every word is changed into uppercase.

Meaning in Header and Footer

For a header and/or footer it is possible to use expressions. It is only possible to use group values such as "$E{first:naam}" instead of the current value, such as "$E{naam}". The value will then be equal to the value the expression had at the beginning of the current section.

1.8.15 <invantive:foreach>...</invantive:foreach>

Sequences from the Model

With <invantive:foreach>...</invantive:foreach> you can repeat a sequence, every time again with different values for the variables. This instruction can be added easily with Building Block.
An example of `<invantive:foreach>...</invantive:foreach>`:

- `<invantive:foreach block="cde" />`: supplies subsequently the data from the block cde that is described in the model.

Apart from the block, you can also enter an alias to later use with the `<invantive:value-of>`. If no alias is specified, the alias will be the same as the value for "block".

### SQL Sequences

Some sequences can not be easily described in the model. That is why with Invantive Composition you can also describe sequences in free text as SQL:

- `<invantive:foreach query="select gbr_naam from bubs_gebruikers_v" />`: provides successively each person's name from the system.

- `<invantive:foreach query="select gbr_naam from bubs_gebruikers_v where gbr_naam = $P{p_naam} order by gbr_naam" />`: provides successively every person's name from the system, which is equal to the value of the parameter p_naam, sorted by name.

- `<invantive:foreach alias="gbr" query="select gbr_naam from bubs_gebruikers_v" />`: successively provides each person's name from the system. These data can also be requested from `<invantive:value-of>` by entering the alias in front of the field code.

The queries you can use '*' to retrieve all fields. With `<invantive:value-of>` you still need to specify the exact field name.

1.8.16 Voorbeeld seriebrief

The following example shows you how to compose a series letter that can be sent to all employees of the company with an overview of their used leave hours.

Perform the following steps:

- Start Microsoft Word.

- Log in to Invantive Composition as described in [Connect](#).

- Make a new file, for example on the basis of the prescribed layout for letters within the company. The end result might be for example:
Set the fixed text in the letter. In this example we assume that we are giving an employee an overview of his recorded leave hours of the last year.

Be careful not to use any unnecessary line breaks or any double spaces. Use styles.

The final template without information from the database is:
Click on 'Install Database' in the Modeller ribbon. This changes the document in a template for Invantive Composition.

With the button 'Design Modus' you shift between being able to edit or not being able to edit the model using 'Edit Model'.

Click on 'Edit Model' and adjust the model as follows:
You wish to be able to print out the letter just for one specific employee which you enter at the start.

That is why you need to enter a parameter as follows in the model:

Then finally choose 'Save' and close the model editor.

You can now leave the design modus by clicking on the button 'Design Modus' one more time.

Next we will add instructions to add data to the letter when the template is opened.

Be careful: Microsoft Word, depending on your settings, changes the straight double quote (") in open or close quotes. If this happens, press Ctrl+Z (undo) immediately; you will then regain the originally entered straight double quote.

We will now add the following query lines and parameters to the document. With these rules Invantive Composition will allow you to automatically fill your document with dynamic texts:

Foreach query rule:
To ensure that the same information layout returns on every document, we add the query line "foreach". This indicates that you want the same information to be applied on every document with the same layout. Within the "foreach" query line you enter all information that you wish to have on the employee. The "foreach" query line looks like this:

```
<invantive:foreach query="select gbr_voornaam || case when gbr_tussenvoegsel is not null then ' ' || gbr_tussenvoegsel end || ' ' || gbr_achternaam gbr_volledige_naam, case when gbr_geslacht_ind='M' then 'heer' else 'mevrouw' end gbr_aanhef_geslacht, gbr_adres_regel_1, gbr_postcode, gbr_plaats, gbr_land, to_char(sysdate, 'dd-mm-yyyy') vandaag, lvr_naam, gbr_baas_funcie, gbr_baas_naam, to_char(add_months(sysdate, -6), 'dd-mm-yyyy') || '-' || to_char(sysdate, 'dd-mm-yyyy') periode, gbr_id from bubs_gebruikers_v where gbr_naam like $P{p_naam_medewerker_patroon} || '%' and lvr_code = '13031406' and gbr_tijdschrijver_vlag = 'Y' order by gbr_naam ">
```

- Now that we have entered the "foreach" query for the document, the different "parameters" for the dynamic filling of the letter need to be added. The first "parameter" that we add is the addressing. This is because this differs for each letter. To automatically add addressing by Invantive Compositions, you add the following "parameters" to the document:

```
<invantive:value-of expression="$F{gbr_volledige_naam}"/>
<invantive:value-of expression="$F{gbr_adres_regel_1}"/>
<invantive:value-of expression="$F{gbr_postcode}"/>
<invantive:value-of expression="$F{gbr_plaats}"/>
<invantive:value-of expression="$F{gbr_land}"/>
```

- The next step is the adding of the "parameters" for the salutation and content information of the serial letter. Here you are also dealing with dynamic texts. The "parameters" that you wish to add automatically you place between the continuous text of your document. The implementation then looks as follows:

```
Subject              Recorded leave during the period <invantive:value-of expression="$F{periode}"/> by <invantive:value-of expression="$F{gbr_volledige_naam}"/>
Appendix(es)          0
Our Reference         <invantive:value-of expression="$P{p_referentie}"/>
Date                  Harderwijk, <invantive:value-of expression="$F{vandaag}"/>
```

- Now that we have added the "parameters" for the salutation we continue with the remainder of the serial letter. The next "parameters" that we add are part of the core of the serial letter. With these "parameters" you ensure the proper mention of the personal data within the letter. By adding the following "parameters" within the ongoing text you allow Invantive Composition to automatically fill the text.

```
Dear <invantive:value-of expression="$F{gbr_aanhef_geslacht}"/> <invantive:value-of expression="$F{gbr_volledige_naam}"/>
```

For your work activities within <invantive:value-of expression="$F{lvr_naam}"/> you accrue leave entitlement. If you make use of leave time then this will be at the expense of accrued leave hours. With this letter we present you with an overview of the recorded leave hours in the recent six months.
• Now that the dynamic texts are automatically added within the serial letter, we add the "parameters" for the leave hours. Because you want to have the same layout for each letter, you again add a "foreach" query line. With this query you retrieve all leave hours from the database and process these by Invantive Composition in the text. The query then looks as follows:

```xml
<invantive:foreach query="select to_char(uur_uren_inspanning, 'FM90D00') uur_uren_inspanning_c, to_char(uur_datum_start, 'dd-mm-yyyy') uur_datum_start_c, uur_commentaar from bubs_uren_v
where gbr_id = $F{gbr_id} and pjt_code like 'IVAC%' and
uur_datum_start > add_months(sysdate, -6) order by
uur_datum_start">
    <invantive:value-of expression="$F{uur_datum_start_c}"/>
    <invantive:value-of expression="$F{uur_uren_inspanning_c}"/>
    uur
</invantive:foreach>

• Now that the leave hours are automatically entered, we close the serial letter with the sender. Here we also make use of "parameters" to automatically fill in the name and function of the sender. We enter the following "parameters":

```xml
<invantive:value-of expression="$F{gbr_baas_naam}"/>
<invantive:value-of expression="$F{gbr_baas_functie}"/>
```

• Now that all "parameters" have been added, we close the document with the following line:

```xml
</invantive:foreach>
```

• The template for the requesting of the leave hours is now finished and looks as follows:

```

```

• Now save the template. For this example I will save the template as "voorbeeld-verlofuren-seriebrief" in Word.

• Now the model is saved Invantive Composition will allow you to publish this with a single click. By publishing the template Invantive Composition will retrieve the data from your database and the "parameters" will automatically be filled.
To request the leave hours of an employee you will proceed as follows.

- Click on "Publish" and let Invantive Composition use the template to fetch the recorded leave.

- Now you see a window appear with "parameters". You will see here the "parameters" name employee and reference letter. This is currently on the setting "wildcard" which means that Invantice Composition does not add reference (this is different per letter) and requests all leave hours of the employees.

To request the leave per employee, replace the "%" in "value" for the name of the employee. Do you want a reference? Fill these in as well then. Subsequently, click on "ok" to publish the model.
• Invantive Composition now asks you under which name and on which disc you want to save the document. Choose a name and drive and save the document.
• Now open the document with the requested leave hours. Your document will look as follows:
1.8.17 Voorbeeld contract

The following example shows you how to compile a contract on the basis of data from a process.

Notice that the document that is filled with data from the database can still be edited afterwards! This way Invantive Composition offers totally different possibilities compared to the standard reporting help resources.

2 Invantive Basics

2.1 Configuration

2.1.1 Customer Service

All Invantive products exchanges messages with a central Customer Service node. These messages include:
• error messages for analysis,
• usage statistics for billing.

On Invantive-internal development workstations only, a non-standard Customer Service node can be selected by specifying a deviating URL in the environment variable `INVANTIVE_CS_BASE_URL`.

### 2.1.2 OS Platform

A variety of Invantive products is available on Windows, Linux and Mac OSX. The list of supported platforms varies per product, depending on the availability of the libraries such as Microsoft .NET Core.

The OS platform is automatically determined by Invantive software, but sometimes can raise bugs given the bleeding edge nature of Microsoft .NET Core. It is possible to overrule the automatic detection of the OS platform by assigning a value to the environment variable `INVANTIVE_FORCED_OS`. The following values are supported:

• windows: Microsoft Windows,
• linux: Linux,
• osx: Mac OSX.

### 2.1.3 Startup Checks

The Invantive products execute a number of checks at application start to ensure that the environment running the software meets a number of pre-conditions as established by Invantive. These checks can be disabled for analysis purposes and out-of-the-ordinary deployment scenarios.

Support on products is only available when checks are not manually configured.

The following environment variables allow manual configuration of the checks by setting them to ‘true’ or ‘false’:

• `INVANTIVE_CHECK_SYSTEM_COMPATIBILITY`: validate system compatibility.
• `INVANTIVE_MAINTAIN_VSTO`: re-activate Invantive VSTO add-ins when disabled.
• `INVANTIVE_CHECK_OS_UPDATES`: validate OS updates have been applied sufficiently recent.

Configuration of checks is solely available on the Windows OS platform.

### 2.1.4 Cryptography

The Invantive products use cryptographic operations to protect:

• License key
• Invantive Keychain

By default, a key pair is used and stored in the profile of the user for encryption and decryption.

**Windows**

On Windows, the encryption is normally done using Windows-managed encryption protocols. The key elements are stored in the roaming profile of the current user.
In some deployment scenarios, a user has only a temporary Windows profile. In that case it is not possible to store a key pair. This is typically signaled by an itgenlic510 error code.

As an alternative, you can configure the environment variable `INVANTIVE_CRYPTOGRAPHY` to the value "MACHINE" to use a key pair that is stored solely on the device.

By setting the environment variable `INVANTIVE_RSA` to `INVANTIVE`, encryption on Windows is also managed as on other platforms by custom Invantive code at the expense of loss of some security features. Often Windows patches break the functionality of previously Windows-managed encryption keys, typically signaled by a error like "Key not valid for use in specified state". Switching to custom Invantive code will solve this problem.

**Linux, Mac OSX, Android, iPhone, Windows on Parallels**

On all other platforms, Invantive offers solely encryption using key elements stored in files in the RSA folder.

### 2.1.5 UI Language

The Invantive products supported approximately ten languages. On first startup, the language of the Windows version will be used when supported. Otherwise US-English is used.

The license decides which from the languages are supported.

Additionally, the user interface language chosen can further be restricted by setting the environment variable `INVANTIVE_ALLOWED_LANGUAGE_CODES` to a comma-separated list of two characters ISO 639-1 codes.

### 2.1.6 Folders

The Invantive products store configuration and runtime information in a folder hierarchy. This hierarchy is located within the Invantive folder of the user profile. It can be opened in Windows Explorer by entering `%USERPROFILE%\Invantive` in the location bar.

The location of the folder hierarchy can be changed using environment variables. The central location can be changed by setting the environment variable `INVANTIVE_CONFIGURATION_FOLDER` to a different folder.

A number of subfolders can be relocated too:

- `INVANTIVE_CONFIGURATION_BACKUP_FOLDER`: the folder with backups of settings files. Defaults to the master folder plus "Backup".
- `INVANTIVE_CONFIGURATION_CACHE_FOLDER`: the folder with disk cache files. Defaults to the master folder plus "Cache".
- `INVANTIVE_CONFIGURATION_HTTP_CACHE_FOLDER`: the folder with HTTP disk cache files. Defaults to the root cache folder plus "http" and the OS-user and front-end user.
- `INVANTIVE_CONFIGURATION_DATA_CACHE_CACHE_FOLDER`: the folder with Data Cache disk cache files. Defaults to the root cache folder plus "datacache". Disk cache files improve performance of HTTP downloads, but when necessary can be purged.
- `INVANTIVE_CONFIGURATION_LOG_FOLDER`: the folder with log files. Defaults to the master folder plus "Log".
- `INVANTIVE_CONFIGURATION_DATABASES_FOLDER`: the folder with databases files. Defaults to the master folder.
• INVANTIVE_CONFIGURATION_PLUGINS_FOLDER: the folder with plugin files. Defaults to the master folder plus "Plugins".

• INVANTIVE_CONFIGURATION_PROVIDERS_FOLDER: the folder with provider files. Defaults to the master folder plus "Providers".

• INVANTIVE_CONFIGURATION_RSA_FOLDER: the folder with RSA configuration files. Defaults to the master folder plus "RSA".

• INVANTIVE_CONFIGURATION_TEMPLATES_FOLDER: the folder with template files. Defaults to the master folder plus "Templates".

• INVANTIVE_CONFIGURATION_TRACE_FOLDER: the folder with trace files. Defaults to the master folder plus "Trace".

The values may contain any combination of the following placeholders which will be expanded:

• iiid: Invantive Installation ID.

• sessionid: Invantiv session ID.

• frontenduser: name of front-end user (when available).

• osuser: name of operating system user.

A folder can be configured for custom translations which overrule all default translations using the environment variable INVANTIVE_I18N_FOLDER.

3 Invantive SQL

One of the most familiar questions at our support desk is "what functions are available" in Invantive SQL to query data in Exact Online.

This second-generation SQL parser is an extensive implementation of many commonly found SQL constructs from the ANSI SQL standard.

It includes in addition to the features of the first-generation SQL parser also:

• joins,

• outer joins,

• cross joins,

• group functions such as stddev, avg and listagg,

• value functions such as xmlescape and round.

There are two flavors shipped:

• Free version: second-generation SQL parser without joins and some upcoming non-ANSI standard advanced mapping functions for large volume financial analysis and reporting.

• Paid version: identical to the free version but with joins and advanced mapping functions.

The EBNF-grammar in Grammar depicts the possibilities.
3.1 Language

3.1.1 Compatibility

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped off with Invantive-specific extensions, especially for procedural SQL, distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few. The same holds for the procedural extension Invantive Procedural SQL, which reflects SQL/PSM and makes it easy to port Oracle PL/SQL or PostgreSQL PL/pgSQL statements.

3.1.2 Distributed SQL, Databases and Data Containers

It is easy to exchange and/or combine data across the supported platforms with data. To each platform (such as Salesforce or Exact Online Belgium) multiple connections can be active with the same or different platform-specific connection settings. Each open connection to a platform is named a 'data container'.

All opened connections together are named a 'database'.

When multiple data containers have been opened, each one has an alias to refer it by in Invantive SQL statements. For instance, a connection can be open for two different customer accounts on Exact Online Netherlands aliased as 'eolnl_comp1' and 'eolnl_comp55') and one for an Exact Online Belgium custom, aliased as 'eolbe_my_new_company'. The aliases can be freely chosen as long as they are valid identifiers and defined in the databases configuration file 'settings.xml'.

3.1.3 Service Providers

A number of special connections are always made, each of which can occur at most once. These are the 'service providers' such as:

- 'datadictionary': metadata of the current database, such as list of tables and executed SQL statements performance.
- 'os': information on the operating system running the SQL engine, such as reading file contents.
- 'smtp': synchronously send mails through SMTP.

3.1.4 Partitioning

Especially online platforms have a multi-tenant structure, in which the data is partitioned per customer, company or person. When the data model is identical across tenants, Invantive SQL considers them 'partitions'. SQL statements can run across multiple or one partitions, often in parallel. This enables consolidation scenarios across partitions (such as Exact Online or Nmbrs companies) as well as high-performance in MPP environments.

The partitions to be used can be specified with the 'use' statement, either through an explicit list of partitions to be selected across data containers, or through a SQL select statement returning the list of partitions to use. Please note that although the 'use' statement resembles the 'use DATABASE' statement on Microsoft SQL Server or PostgreSQL you can on Invantive SQL have multiple partitions active at the same time in one user session.

3.1.5 Identifiers

For identifiers, the regular conventions hold for the set of allowed characters. Depending on the platform, the identifiers are case sensitive or not. In general, it is best to assume that the
identifier are case insensitive. There is no length limit on an identifier imposed by Invantive SQL.

3.1.6 Procedural SQL

Invantive Procedural SQL (or "PSQL" for short) is a procedural extension on top of Invantive SQL. It is based on the ISO-standard 9075-4:2016 (SQL/PSM) and extends Invantive SQL with procedural options like blocks, variables, conditional execution and loops. The procedural code is - together with the Invantive SQL contained - as a whole into pseudo-code and then executed.

The procedural code does not lean on the procedural options of the platforms being used, so it is easy to retrieve and change data in all supported cloud, file and database platforms. The pre-compiled procedural code does not perform context switches between procedural and SQL logic.

3.1.7 Licensing

The available functionality of Invantive SQL features is based upon the license features. For instance the free implementation of Invantive SQL is limited to 1.000 rows and no access to group functions. Please consult the data dictionary contents for your license features.

3.1.8 Settings.xml

The file settings.xml defines for a user or program the list of defined databases. Databases are grouped in 'database groups' for visual display. Database groups have no further functionality. Each database consists of one or multiple data containers.

The file 'settings.xml' is most often found on Microsoft Windows in your '%USERPROFILE% \invantive' folder, such as 'c:\users\john.doe\invantive\settings.xml'. It is shared across all Invantive SQL product installations for the user.

There are many scenarios to share database specifications across a user community, such as WAN-scenarios with Invantive Web Service, large corporate scenarios using DNS-entries as well as file shares, included files as well as single user solutions. Please involve a consultant when you want to deploy across thousands of users or more.

For user communities of up to 10 users, we recommend that company-specific settings are grouped per role in a separate file named 'settings-ROLE.xml' and placed in the default folder. Invantive SQL will automatically merge these files in the main settings.xml file.

3.1.9 Group Functions

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped of with Invantive-specific extensions, especially for distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few.

Popular group functions such as 'stddev' are available. However, currently you can not combine in one unnested SQL statement both group functions as well as expressions on the variables. In that case use an inner (nested) SQL statement to apply the expressions on the data, and execute the group functions in the outer SQL statement with the syntax 'select group() from ( select ... from ... )'.
3.1.10 Locking

An Invantive SQL statement can work with many traditional and online platforms. There are no locking features on data and objects, since few online and traditional platforms connected provide these and the typical use of distributed transactions leave even less opportunity for data and object locking.

3.1.11 Transactions

Invantive SQL has limited support for transactions. DML is forwarded to a platform and depending on the platform an error can cause part of the work to be registered or everything to be rolled back. Within the SQL engine, multiple changes can be collected and forwarded to the platform at once. For instance, when creating an EDIFACT message you need to combine an invoice header with invoice lines into one EDIFACT message. Collection of multiple changes is done using the 'identified by' and 'attach to' syntax, optionally preceded by 'begin transaction'.

3.1.12 Grammar

sqlBatch:

sqlOrPSqlStatement BATCHSEPARATOR BATCHSEPARATOR
sqlBatch := sqlOrPSqlStatement ( BATCHSEPARATOR sqlOrPSqlStatement ) * BATCHSEPARATOR?

no references

sqlOrPSqlStatement:

sqlStatement pSqlStatement
sqlOrPSqlStatement := sqlStatement | pSqlStatement

referenced by:
  • sqlBatch

sqlStatement:

An Invantive SQL can retrieve data from many traditional and online platforms. Many platforms also support the use of DML (Data Manipulation Language) statements to change the data contained. On a few platforms you can execute DDL (Data Definition Language) statements to create new data structure or objects such as tables, procedures or sequences.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
selectStatement:

A SQL select statement retrieves data from one or multiple data containers. A select statement can be composed of multiple data sets retrieved from many platforms, combined by set operators such as 'union'.

Often the performance of cloud platforms is less than traditional database platforms. With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'. An alternative for a 'limit' clause is to use the 'top' clause.

A sequence of Invantive SQL statements, separated by the semi-colon separator character.

Each statement in the SQL batch will be executed consecutively. Execution will be stopped when an error occurs during execution of a statement.

selectStatement setOperatorSelectStatement orderBy limitClause

::= uniqueSelectStatement

inSelectStatement:

A SQL select statement retrieves data from one or multiple data containers. This variant makes this data available to a containing SQL select statement. This feature is also known as an 'inline view'.

selectStatement

::= selectStatement

setOperatorSelectStatement:

SQL is based upon a solid mathematical foundation named 'set theory' with some exceptions. The set operators of Invantive SQL enable you to combine sets of data sets such as
merging two sets of data. Please note that SQL actually uses 'bags', which opposed to 'sets', allow duplicates. To change bags of data into sets, either use 'distinct' or the 'union' set operator without 'all'. In general, the extensive use of 'distinct' signals bad database design.

The 'union' set operator returns the union of the data on the left and right side of the union while removing duplicate rows. The 'union all' set operator returns the union of the data on the left and right side of the union without removing duplicate rows. The 'minus' set operator returns all rows from the left side which do not occur in the right side. The 'intersect' set operator returns all rows that occur both in the left and right side.

```sql
UNION ALL MINUS_C INTERSECT uniqueSelectStatement
```
executionHints:

Execution hints allow you to control individually the execution of SQL statements. Whenever possible, the hints will be used. In contrary to other platforms, Invantive SQL requires a hint to be valid according to the grammar when specified. This reduces the engineering risk that hints become invalid by accident.

EXECUTION_HINT_START joinSet noJoinSet ods resultSetName lowCost httpDiskCache httpMemoryCache EXECUTION_HINT_END

httpDiskCache:

The http_disk_cache-hint specifies whether messages may be cached on disk when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the disk cache, the second parameter is a boolean whether data retrieved must be stored also in the disk cache and the third parameter is an integer that specifies the number of seconds before a disk cache hit found is to be considered stale.

The use of the http_disk-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents of the disk cache are persistent across Invantive SQL sessions.

The disk cache is located in the Cache folder of the Invantive configuration folder.

HTTP_DISK_CACHE PARENTHESES_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESES_CLOSE

httpMemoryCache:

The http_memory_cache-hint specifies whether messages may be cached in memory when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the memory cache, the second parameter is a boolean whether data retrieved must be stored also in the memory cache and the third parameter is an integer that specifies the number of seconds before a memory cache hit found is to be considered stale.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
The use of the http_memory-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents in the memory cache are forgotten across Invantive SQL sessions.

The memory cache is located in the Cache folder of the Invantive configuration folder.

ods:
The ods-hint controls the use of the Invantive Data Cache stored in a relational database. The Invantive Data Cache is also the basis of the Operational Data Store managed by Invantive Data Replicator and the data warehouses managed by Invantive Data Vault. The ods-hint specifies the maximum age data from the data cache eligible for use.

The boolean specifies whether the Data Cache may be used to answer a query. Set it to false to disable use of Data Cache for the duration of the query. Keep it on the default true to use Data Cache.

The interval specifies the period of time during which cached results are considered sufficiently fresh for use, such as '30 minutes'.

When no interval is present, the actual platform is consulted. The default with Invantive Data Cache enabled is to always use the data cache contents when not stale according to the metadata of the data cache. In general, that defaults to a maximum age of 7 days.

joinSet:
Control join approach between two data sources. A column-indexed lookup will be used instead of a full table scan when the number of rows on the left-hand side does not exceed the maximum number of rows specified in the hint. When not specified, a hash lookup will only be used when the number of rows on the left-side does not exceed 5.000.

The actual implementation of a hash lookup depends on the platform on which the data container runs. For instance with OData, a number of requests will be made using an in-construct with a limited number of in-values. With a relation database platform, a native SQL 'in' will be used.

The first identifier is the alias of the table on the right-hand side of the join. The second identifier is the name of the column used to join upon in the right-hand side. The numeric constant specifies up to what number of rows on the left-hand side of the join will allow the join set hint to be used. When the number of rows exceeds the numeric constant, a full table join is made.

The following example takes for instances 5.000 sales invoices from an Exact Online environment with 100.000 sales invoices. Each sales invoice has 4..10 lines. The join does not retrieve all sales invoices nor all invoice lines, but instead fetches the 5.000 sales invoices using the where-clause, and then retrieves the related invoice lines using a column-indexed lookup by invoiceid. Since Exact Online is an OData source, the approximately 30.000 invoice lines will be retrieved in 300 session I/Os each having an in-construct for 100 lines on invoiceid.

```sql
select /*+ join_set(sil, invoiceid, 10000) */ * from ExactOnlineREST..SalesInvoices sik join ExactOnlineREST..SalesInvoiceLines sil on sil.invoiceid = sik.invoiceid where sik.status = 50 and sik.InvoiceDate between to_date( :P_RECEIPT_DATE_FROM , 'yyyymmdd') and to_date( :P_RECEIPT_DATE_TO, 'yyyymmdd')
```

lowCost:

The low_cost-hint specifies that the select with the hint must be considered a select with low execution costs. Low execution costs trigger early evaluation during parsing. By default, select statements using solely in memory storage, dummy and data dictionary are considered low cost and evaluated early. The evaluation of all others is delayed as long as possible.

The use of the low_cost-hint is recommended when the select is used with a 'in ( select ... )' syntax and the developer knows beforehand that it will evaluate fast to values and that the use of these values will allow the use of server-side filtering for the outer select.

LOW_COST

lowCost ::= LOW_COST

referenced by:

• executionHints

distinct:

Addition of the 'distinct' keyword to a SQL select statement de-duplicates the rows returned. Rows are considered duplicates when the values in all selected columns are identical, with two null-values considered equal.

**embeddedSelect:**

An embedded select, also known as an 'inline view', retrieves rows using the specified select statement. These rows are consumed by the outer select as were it the results of retrieving the rows from a table.

Invantive SQL does not allow grouping rows with expressions as columns. An embedded select is typically used to evaluate expressions to rows with solely constants. After applying the embedded select the group operators can be applied.

**tableSpec:**

A table specification without parameters. The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

A number of special so-called 'service providers' are always present, such as 'datadictionary' for use by an alias.

```
fullTableIdentifier distributedAliasDirective
tableSpec ::= fullTableIdentifier distributedAliasDirective
```

- `updateStatement`[^69]

**tableOrFunctionSpec:**

A table specification requiring a comma-separated list of parameters to determine the rows to be retrieved.

Traditional SQL syntax did not provide for parameterized queries, matching set theory. Modern variants such as pipelined table functions allow a stored procedure or other imperative language-based approaches to generate rows based upon parameter values. Many data...
containers support queries that return rows based upon parameter values. This holds especially for SOAP web services. Table specifications with parameters ease queries on such data containers.

The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

**fullTableIdentifier tableFunctionSpec distributedAliasDirective**

```plaintext
  tableOrFunctionSpec ::= fullTableIdentifier tableFunctionSpec distributedAliasDirective
```

referred by:
- **dataSource**

**tableFunctionSpec:**

A comma-separated list of parameters to determine the rows to be retrieved by a tableOrFunctionSpec.

```plaintext
  parenthesisOpen expression COMMA parenthesisClose
  tableFunctionSpec ::= parenthesisOpen ( expression COMMA expression )? parenthesisClose
```

referred by:
- **tableOrFunctionSpec**

**distributedAliasDirective:**

The distributed alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

A number of special so-called 'service providers' are always present, such as 'datadictionary' for use by an alias.

**AT dataContainerAlias**

```plaintext
  distributedAliasDirective ::= AT dataContainerAlias
```

referred by:
- **partitionIdentifierWithAlias**
- **setIdentifier**
- **tableOrFunctionSpec**
- **tableSpec**

**dataContainerAlias:**

When multiple data containers have been defined in settings.xml for a database, each one is assigned an alias. An alias typically takes the form of a limited number of characters. The
presence of an alias allows Invantive SQL to precisely determine to what data container forward a request for data.

groupBy:

Grouping of multiple rows into groups is specified by the groupBy. A group will be introduced for each distinct combination of column values for the columns listed. The values of grouped columns can be used in the select clause. Columns not being grouped upon can only be used within the context of a group function listed as 'aggregateFunction'.

GROUP BY columnList

groupBy ::= GROUP BY columnList

referenced by:
  • uniqueSelectStatement

orderBy:

Sort the rows returned as specified by the list of columns. Values are either sorted ascending (the default) or descending.

ORDER BY column sortDirection COMMA

orderBy ::= ORDER BY column sortDirection? ( COMMA? )*

referenced by:
  • aggregateFunction
  • selectStatement
sortDirection:
A sort direction can be either 'asc' for 'ascending' (the default) or 'desc' for 'descending'.

```
sortDirection ::= asc | desc
```

referenced by:

columnList:
A comma-separated list of columns.

```
columnList ::= column ( COMMA column )*
```

referenced by:
- `groupBy` [51]
- `insertFieldList` [68]

column:
A column is identified by an identifier, possibly prefixed by the name of the table or the alias of the table from which the column is to be taken.

```
column ::= identifier ( DOT identifier )?
```

referenced by:
- `columnList` [52]
- `orderBy` [51]
- `updateValue` [69]

whereClause:
The where-clause restricts the number of rows in a result set by applying one or more boolean conditions which rows must satisfy.

```
whereClause ::= WHERE booleanExpression
```

referenced by:
- `deleteStatement` [67]
- `uniqueSelectStatement` [39]
- `updateStatement` [69]

joinStatements:
A list of join statement.

joinStatement

joinStatements ::= joinStatement+

referenced by:
- uniqueSelectStatement

joinStatement:

A join statement combines two result sets. Only combinations of rows taken from both result sets are returned when they meet the join conditions.

joinCategory join dataSource joinConditions

joinStatement ::= joinCategory join dataSource joinConditions

referenced by:
- joinStatements

joinCategory:

The join category specifies what combinations of rows are considered. The following variants can be used:

- inner join, as indicated by 'join' or 'inner join': an inner join returns all combinations of rows from both result sets that meet the join conditions.
- left outer, as indicated by 'left outer join': a left outer join returns the same rows as an inner join, extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- right outer, as indicated by 'right outer join': a right outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. Each column that originates from the left result set is assigned a null value.
- full outer, as indicated by 'full outer join': a full outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. Each column that originates from the left result set is assigned a null value. The results are also extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- cross join, as indicated by 'cross join': a cross join returns a Cartesian product of the rows from both result sets. A 'Cartesian product' is a term from set theory, which indicates that all combinations are returned.

inner joinSubCategory outer cross

joinCategory ::= ( inner | joinSubCategory outer? | cross )?

referenced by:
- joinStatement

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
joinSubCategory:
The join sub-category refines the join category. Please see 'joinCategory' for an explanation.

ddlStatement:
createTableStatement dropTableStatement alterPersistentCacheStatement

\[
\text{ddlStatement} :\!::= \text{createTableStatement} \mid \text{dropTableStatement} \mid \text{alterPersistentCacheStatement}
\]

referenced by:
- sqlStatement

**alterPersistentCacheStatement:**

Besides an in-memory cache valid during the duration of a session, Invantive SQL offers an
integrated cache storing data persistently using an on-premise or cloud relation database
such as SQL Server or PostgreSQL. When configured, Invantive SQL first tries to find suffi-
ciently fresh data in the cache. This reduces the number of data loads from slow data con-
tainers such as some cloud platforms. In general, the performance increase when the rows
can be fully retrieved from a cache is between a factor 25 and 2.500.

Invantive SQL itself manages the table structure and table contents in the relation database
used as a data cache. On initial use just provide an empty database. Invantive SQL installs a
repository consisting of a few tables. The repository tables have names starting with 'dc_'.

For each table partition version, a so-called facts table is created. A facts table contains a full
copy of the rows retrieved from the data container. Facts tables have names starting with
'dcd_', followed by a unique hash signaling the table partition version. When necessary, addi-
tional database objects are maintained such as indexes to improve performance. As with
facts table names, all column names are also hashed based upon an algorithm including the
original column name. These facts tables are not intended for direct use using native SQL.

Each facts table has a unique state from the following state, with Ready state signaling the
now current version:
- Initializing ('I'): the facts table will be created.
- View creation ('V'): logical views will be created.
- Prepared ('P'): the facts table has been created, but contains yet no rows.
- Seeding ('S'): the facts table is being seeded with the contents of the previously current ver-
sion.
- Loading ('L'): loading new facts from data container using water shed or another algorithm.
- Ready ('R'): the facts table is available and the current one to be used.
- Obsoleted ('O'): the facts table still exists, but the data has passed it's conservation period.
  Often a newer version is now current.
- Dropped ('D'): the facts table now longer exist, but the metadata is still present in the reposi-
  tory tables.

The persistent cache in the database can be used with native SQL when extended by In-
vantive Data Replicator. Invantive Data Replicator can create and maintain a database view
(a so-called 'partition view') for the now current version of table partition. Similarly, it can cre-
ate an 'overall view', showing the rows across all partitions of the now current versions per
partition.

The overall views are typically used for consolidation purposes, bringing together data across
multiple companies or persons.

beginTransactionStatement:
A begin transaction statement initiates a transaction. Invantive SQL typically provides no transaction logic given the distributed nature and the limitations of the possible platforms. Some platforms enable collection of transaction data, which are to be handed over to the backing platform all together.

BEGIN TRANSACTION

beginTransactionStatement ::= BEGIN TRANSACTION?

referenced by:
- transactionStatement

rollbackTransactionStatement:
Forgets all collected transaction data not yet handed over to the backing platform.

ROLLBACK TRANSACTION

rollbackTransactionStatement ::= ROLLBACK TRANSACTION?

referenced by:
- transactionStatement

commitTransactionStatement:
Hand over all collected transaction to the backing platform for registration.

COMMIT TRANSACTION

commitTransactionStatement ::= COMMIT TRANSACTION?

referenced by:
- transactionStatement

useStatement:
The use statement enables you to specify which partitions should be accessed by subsequent select, insert, update and delete statements. You can specify one or multiple partitions as a comma-separated list, possibly for a specific data container by appending an at-sign plus data container alias to the partition code. The value 'default' has a special meaning; it specifies to use the partition(s) originally selected when you logged on. The value 'all' also has a special meaning: it selects all partitions available.

For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use 35@eolnl, 57345@nmbrsnl'.

For complex scenarios, you can specify any valid Invantive SQL select statement which returns one or two columns. Each row from the query specifies one partition to select. The first column specifies the partition code, whereas the optional second column specifies a specific data container alias.
For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use select '35', 'eolnl' from dual@datadictionary union all select '57345', 'nmbrsnl' from dual@datadictionary'.

abs:

Returns the absolute value of a double-precision floating-point number.

Parameters:

- Input: A number that is greater than or equal to System.Double.MinValue, but less than or equal to System.Double.MaxValue.

Returns: A double-precision floating-point number. ABS

```
abs ::= ABS
```

referenced by:

- functionExpression

acos:

Returns the angle of the provided cosine.

Parameters:

- Input: the cosine to get the angle of.

Returns: A number which represents the angle of the provided cosine. ACOS

```
acos ::= ACOS
```

referenced by:

- functionExpression

anonymize:

Anonymize a text or number. Anonymization is executed such that when the same original value is anonymized within the same session, the anonymized value will be identical. The anonymized value also uniquely matches the original value. With no access to the anonymization map however, the original value can however not be calculated from the anonymized value.

In mathematics, the anonymization function is a bijection: each element of the original set is paired with exactly one element of the anonymized set, and each element of the anonymized set is paired with exactly one element of the original set.

Parameters:

- Value: A text or number to be obfuscated.
- Maximum length (optional): Maximum length in digits for numbers or characters for text of anonymized value. Null means no restriction on maximum length.
- Mapping (optional): algorithm to use. The default algorithm is 'DEFAULT' which maps text values to a range of hexadecimal characters and numbers to a range of numbers. Alternative mappings are described below.

The following anonymization maps are available on installation:

- DEFAULT: the default algorithm.
- IVE-GL-JOURNAL-DESCRIPTION: general ledger journal descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
- IVE-GL-ACCOUNT-DESCRIPTION: general ledger account descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
- IVE-PSN-FIRST-NAME: person first names: prefer readable alternative first names, anonymize all.
- IVE-PSN-LAST-NAME: person last names: prefer readable alternative last names, anonymize all.
- IVE-ADS-CITY-NAME: address city names: prefer readable alternative city names, anonymize all.
- IVE-ADS-STREET-NAME: address street names: prefer readable alternative street names, anonymize all.

The data dictionary contains the anonymization maps used so far in the session and their corresponding values:

```
select * from SystemAnonymizationMaps@DataDictionary
select * from SystemAnonymizationMapValues@DataDictionary
select * from SystemAnonymizationPredefinedMaps@DataDictionary
```

Returns: Anonymized value. ANONYMIZE

```
anonymize ::= ANONYMIZE
```

referenced by:

`ascii`:
Get the position of a character on database character set.

Parameters:
- Input: character to get position from.

Returns: The position of the character on database character set. ASCII

```
ascii ::= ASCII
```

referenced by:
- `functionExpression`

`asin`:
Returns the angle of the provided sine.

Parameters:
- Input: the sine to get the angle of.

Returns: A number which represents the angle of the provided sine. ASIN

```
asin ::= ASIN
```

referenced by:
- `functionExpression`

`atan`:
Returns the angle of the provided tangent.
Parameters:
- Input: the tangent to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN

\[ \text{atan} \left( \text{Input} \right) := \text{ATAN} \left( \text{Input} \right) \]

referenced by:
- functionExpression

\text{atan2}:

Returns the angle of the provided tangent.

Parameters:
- First number: the first number to get the angle of.
- Second number: the second to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN2

\[ \text{atan2} \left( \text{First number}, \text{Second number} \right) := \text{ATAN2} \left( \text{First number}, \text{Second number} \right) \]

referenced by:
- functionExpression

\text{add\_months}:

Add an amount of months to a datetime.

Parameters:
- Date: datetime to ass the months to.
- Months: the amount of months to add.

Returns: A new datetime with the amount of months added. ADD_MONTHS

\[ \text{add\_months} \left( \text{Date}, \text{Months} \right) := \text{ADD\_MONTHS} \left( \text{Date}, \text{Months} \right) \]

referenced by:
- functionExpression

\text{base64\_decode}:

Converts the base64_encoded value back to the binary value as defined on Wikipedia.

Parameters:
- Input: value to convert back to the original.

Returns: The input decoded back to the binary value. BASE64\_DECODE

\[ \text{base64\_decode} \left( \text{Input} \right) := \text{BASE64\_DECODE} \left( \text{Input} \right) \]

referenced by:
- functionExpression

\text{base64\_encode}:
Converts a binary value to base64_encoded characters as defined on Wikipedia.

Parameters:
- **Input**: value to convert to base64 characters.

Returns: The input encoded to base64 characters. BASE64_ENCODE

```
base64_encode [82]
:: = BASE64_ENCODE [82]
```

Referenced by:
- **functionExpression** [78]

**camel**:

Converts provided string to Camel case.

Parameters:
- **Input**: the string that will be converted to Camel case.

Returns: A string converted to Camel case. CAMEL

```
camel [82]
:: = CAMEL [82]
```

Referenced by:
- **functionExpression** [78]

**ceil**:

Rounds the input to the largest following integer. Unless an amount of decimals is defined, in which case it rounds to the largest integer number with the amount of decimals or date with the amount of positions.

Parameters:
- **Input**: A number or datetime to ceil.
- **Decimals [optional]**: A number to specify how many decimals it may ceil to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The ceiling of the input. CEIL

```
ceil [82]
:: = CEIL [82]
```

Referenced by:
- **functionExpression** [78]

**chr**:

Get a character from database character set.

Parameters:
- **Input**: a numeric value of a character.

Returns: A character from the database character set. CHR CHAR

```
chr [82]
:: = CHR [82]
| CHAR [37]
```

bit_length:
Get the number of bits needed to represent a value. For a blob, this is the number of bits for
the bytes of the blob. For all other data types, the value is first converted to a string and then
the number of bits of the UTF8 representation is determined.
Parameters:
• Value: value to determine length in bits for.
Returns: number of bits needed to represent the value. BIT_LENGTH

bit_length ::= BIT_LENGTH

referenced by:
• functionExpression

octet_length:
Get the number of bytes needed to represent a value. For a blob, this is the number of bytes
of the blob. For all other data types, the value is first converted to a string and then the num-
ber of bytes of the UTF8 representation is determined.
Parameters:
• Value: value to determine length in bytes for.
Returns: number of bytes needed to represent the value. OCTET_LENGTH

octet_length ::= OCTET_LENGTH

referenced by:
• functionExpression

repeat:
Get a concatenation of the text by a number of times.
Parameters:
• Text: text to repeat.
• Times: number of time to repeat the text.
Returns: the text repeated a number of times. REPEAT

repeat ::= REPEAT

referenced by:
• functionExpression

raise_error:
RAISE_ERROR

raise_error ::= RAISE_ERROR

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
coalesce:
Performs a coalescing operation.
Parameters:
  - Left: an object.
  - Right: an object.
Returns: the left value if right is empty, otherwise the right value. COALESCE
  \[
  \text{coalesce} \ ::= \text{COALESCE}
  \]

concat:
Concatenate the left and right values together as a text.

\[
\text{concat} \ ::= \text{CONCAT}_\text{OP}
\]

concat_func:
Concatenate a list of values together as a text.

\[
\text{concat_func} \ ::= \text{CONCAT}
\]

cos:
Returns the cosine of the provided angle.
Parameters:
  - Input: the angle to get the cosine of.
Returns: A number which represents the cosine of the provided angle. COS
  \[
  \text{cos} \ ::= \text{COS}
  \]

**dateadd:**

Adds an amount of time to a date.

Parameters:

- Interval: the date interval to be added.
- Number: the number of intervals to add.
- Date: the date to which the interval should be added.

Returns: The original date with the number of intervals added. DATEADD

\[
\text{dateadd} \::= \text{DATEADD}
\]

referenced by:

- functionExpression

**datepart:**

Get the specified datepart from a datetime.

Parameters:

- datepart: a part of a date.
- date: a datetime to get the datepart from.

Returns: a part of a datetime. DATEPART

\[
\text{datepart} \::= \text{DATEPART}
\]

**divide**: Divide one number by the second number.

Parameters:
- first: a number to divide.
- second: a number to divide with.

Returns: the divided output. \text{DIVIDE}

\[
\text{divide} \ ::= \text{DIVIDE}
\]

**exp**: Returns the provided number raised to the specified power.

Parameters:
- Input: the number to raise by the specified power.

Returns: A number which is the provided number raised to the specified power. \text{EXP_OP}

\[
\text{exp} \ ::= \text{EXP_OP}
\]

**floor**: Rounds the input to the smallest following integer. Unless an amount of decimals is defined, in which case it rounds to the smallest integer with the amount of decimals or date with the amount of positions.

Parameters:
- Input: A number or datetime to floor.
- Decimals [optional]: A number to specify how many decimals it may floor to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The floor of the input. \text{FLOOR}

\[
\text{floor} \ ::= \text{FLOOR}
\]
from_unixtime:
Get the date/time from an integer representing a UNIX epoch time.
Parameters:
- Input: An integer.
Returns: The date/time which the UNIX epoch time represents. FROM_UNIXTIME
  from_unixtime ::= FROM_UNIXTIME
referenced by:
  - functionExpression

hour:
Collect the hour from a date.
Parameters:
- Input: A date
Returns: The hour as an integer. HOUR
  hour ::= HOUR
referenced by:
  - functionExpression

initcap:
Changes the first letter of each word in uppercase, all other letters in lowercase.
Parameters:
- Input: Text to convert.
Returns: The input with the first letter of each word in uppercase. INITCAP
  initcap ::= INITCAP
referenced by:
  - functionExpression

instr:
Get a number which is a position of the first occurrence of substring in the string.
Parameters:
- String: String to be searched.
- Substring: Text to search for.
- StartPosition [optional]: Position of string to start searching.
- occurrence [optional]: Return the position of the occurrence.
Returns: The position of the substring inside the original string. INSTR
  instr ::= INSTR

In:

Get the natural logarithm of a number.

Parameters:

- Input: a number to get the natural logarithm from.

Returns: The natural logarithm of the input. LN

\[
\text{ln} := \text{LN}
\]

referred by:

- functionExpression

log:

Get the natural logarithm of a number in a specified base.

Parameters:

- Input: a number to get the natural logarithm from.
- Base [optional]: the base to get the natural logarithm from.

Returns: The natural logarithm of the input in the specified base. LOG

\[
\text{log} := \text{LOG}
\]

referred by:

- functionExpression

lower:

Converts provided string to lowercase.

Parameters:

- Input: the string that will be converted to lowercase.

Returns: A string converted to lowercase. LOWER

\[
\text{lower} := \text{LOWER}
\]

referred by:

- functionExpression

lpad:

Pad a string to the left to make it a specified length.

Parameters:

- Input: string to be padded.
- Length: the length the string should be padded to.
- Characters [optional]: Characters to pad with.

Returns: A string padded to the left to a given length with the optional specified characters. LPAD

\[
\text{lpad} := \text{LPAD}
\]

referred by:

- functionExpression
ltrim:
Trims characters from the left side of a string.
Parameters:
- Input: the string from to trim characters from the left side.
- (Optional) Chars to trim: the character to trim. Default is "."

Returns: A string with chars trimmed from the left. LTRIM

md5:
Converts a value to a 128-bit hash value as defined on Wikipedia.
Parameters:
- Input: Text to convert with MD5.

Returns: The input converted with MD5. MD5

metaphone:
Converts a value to the Metaphone code as defined on Wikipedia.
Parameters:
- Input: value to convert to metaphone.
- Length: maximum output length of the given input.

Returns: The input converted to metaphone, with a given output length. METAPHONE

metaphone3:
METAPHONE3

plus:

Adding a value to another.

Parameters:
- Value: a number or datetime.
- add: a number or datetime.

Returns: A new value with both values added to each other. PLUS

plus ::= PLU S

referenced by:
- arithmeticExpression

power:

Gets a value of a number raised to another.

Parameters:
- Value: a number.
- exponent: a number.
Returns: The value of a number raised to another. POWER

\[
\text{power} \::= \text{POWER}
\]

referenced by:
- \text{functionExpression}

\section{random}

Generates a random number between 0 and 1.

Parameters:
- Seed: Produce a repeatable sequence of random numbers each time that seed value is provided.

Returns: A random number between 0 and 1. RANDOM

\[
\text{random} \::= \text{RANDOM}
\]

referenced by:
- \text{functionExpression}

\section{random_blob}

Generates a blob with pseudo-random values.

Parameters:
- Length: Produce a blob with this length in terms of bytes.

Returns: A blob with pseudo-random values. RANDOM_BLOB

\[
\text{random\_blob} \::= \text{RANDOM\_BLOB}
\]

\section{regexp_substr}

Extracts a substring from the given value using regular expression.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the substr operation.
- Match parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The substring from the input. REGEXP_SUBSTR

\[\text{regexp} \_\text{substr} \]::= \text{REGEXP} \_\text{SUBSTR} \[\text{95}\]

referenced by:
- \text{functionExpression} \[\text{78}\]

\text{regexp} \_\text{instr}:

Determine the position of the regular expression in the given value. Returns 0 when the regular expression is not contained in the given value.

Parameters:
- Input: The text to get the regular expression position from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the instr operation.
- ReturnOption [optional]: Select either the first character found or the first character after the occurrence of the pattern.
- Match parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The location of a regular expression pattern in the input. REGEXP_INSTR

\[\text{regexp} \_\text{instr} \]::= \text{REGEXP} \_\text{INSTR} \[\text{96}\]

referenced by:
- \text{functionExpression} \[\text{78}\]

\text{regexp} \_\text{replace}:

Replaces all occurrences matching the regular expression with the replacement value. The replacement value may contain references to matches in the regular expression by using the dollar-sign ('$') plus the reference number.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Replacement [optional]: Text to replace with.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the replace operation.
• Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function. The available options are 'c' for case-sensitive, 'i' for ignore case, 'n' for single-line, 'm' for multi-line and 'x' for ignore pattern white space.

Returns: The input with every occurrence of the regular expression pattern replaced with the replacement.

\texttt{REGEXP\_REPLACE}

\begin{verbatim}
\texttt{regexp\_replace} ::= \texttt{REGEXP\_REPLACE}
\end{verbatim}

referenced by:
• \texttt{functionExpression}

\texttt{remainder}:
Get the remainder of a divide calculation.

The \texttt{REMAINDER} function uses the round function in its formula, whereas the \texttt{MOD} function uses the floor function in its formula.

Parameters:
• Number1: a number.
• Number2: a number.

Returns: The remainder. \texttt{REMAINDER}

\begin{verbatim}
\texttt{remainder} ::= \texttt{REMAINDER}
\end{verbatim}

referenced by:
• \texttt{functionExpression}

\texttt{replace}:
Replaces a string with string in given string.

Parameters:
• Input: the string to replace a string in.
• Old text: the string to be replaced.
• New text: the string which 'Old text' will be replaced with.

Returns: A string with the replaced string. \texttt{REPLACE}

\begin{verbatim}
\texttt{replace} ::= \texttt{REPLACE}
\end{verbatim}

referenced by:
• \texttt{functionExpression}

\texttt{reverse}:
Flips the input around.

Parameters:
• Input: text to flip around.

Returns: The text with it's characters in reversed order. \texttt{REVERSE}
reverse := REVERSE

Referenced by:
- functionExpression

round:
Rounds the input to the closest following integer. Unless an amount of decimals is defined, in which case it rounds to the closest integer number with the amount of decimals or date with the amount of positions.

Parameters:
- Input: A number or datetime to round.
- Decimals [optional]: A number to specify how many decimals it may round to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The rounded input. ROUND

Referenced by:
- functionExpression

row_number:
ROW_NUMBER

Referenced by:
- functionExpression

rpad:
Rightpad function pads the right-side of a string with a specific set of characters to the given length. When no set of characters given, it will pad with a whitespace.

Parameters:
- Input: Text to be padded.
- Length: The length to make the input to.
- Pad text [optional]: Text to add to the input if the length is larger then the input.

Returns: The padded text, or null if the string cannot be padded. RPAD

Referenced by:
- functionExpression

rtrim:
Trims characters from the right side of a string.

Parameters:
- Input: the string from which to trim characters from the right side.
- (Optional) Chars to trim: the character to trim. Default is " ".

Returns: A string with chars trimmed from the right. RTRIM

```sql
rtrim ::= RTRIM
```

referred by:
- `functionExpression`

---

**microsecond:**

Collect the microsecond from a date.

Parameters:
- Input: A `date Time`.

Returns: The microsecond as an integer. MICROSECOND

```sql
microsecond ::= MICROSECOND
```

referred by:
- `functionExpression`

---

**millisecond:**

Collect the millisecond from a date.

Parameters:
- Input: A `date Time`.

Returns: The millisecond as an integer. MILLISECOND

```sql
millisecond ::= MILLISECOND
```

referred by:
- `functionExpression`

---

**number_to_speech:**

NUMBER_TO_SPEECH

```sql
number_to_speech ::= NUMBER_TO_SPEECH
```

referred by:
- `functionExpression`

---

**normalize:**

Normalize a file path by replacing all invalid and non-ASCII characters for use in a file path by underscore. After that, the file path is made more readable by various operations such as removal of duplicate whitespace and underscore characters.

Parameters:
- Original file path: path of the file.
• Maximum file name length: length in characters into which the normalized file name must fit.
  • Allow path separator: whether to allow the path separator \" in the normalized file name.
  
  When not, occurrences are replaced.

Returns: a normalized file path. NORMALIZE

\[\text{normalize} ::= \text{NORMALIZE}\]

referenced by:

• functionExpression

second:

Collect the second from a date.

Parameters:
  • Input: A dateTime.

Returns: The second as an integer. SECOND

\[\text{second} ::= \text{SECOND}\]

referenced by:

• functionExpression

soundex:

Converts a value to the Soundex code as defined on Wikipedia.

Parameters:
  • Input: Text to that retrieve the soundex value from.

Returns: A text started with a number and followed by 3 digits. SOUNDEX

\[\text{soundex} ::= \text{SOUNDEX}\]

referenced by:

• functionExpression

sin:

Returns the sine of the provided angle.

Parameters:
  • Input: the angle to get the sine of.

Returns: A number which represents the sine of the provided angle. SIN

\[\text{sin} ::= \text{SIN}\]

referenced by:

• functionExpression

sqrt:

Returns the square root of the provided number.
Parameters:
- Input: the number to get the square root of.

Returns: A number which represents the square root of the provided number. SQRT
\[ \texttt{sqrt} \] \[ := \texttt{SQRT} \]

referenced by:
- \texttt{functionExpression}

\textbf{substr:}

Gets a substring from the input.

Parameters:
- Input: text to gather the substring from.
- Start: start position.
- Length: maximum length of the substring.

Returns: The substring from the original input. SUBSTR
\[ \texttt{substr} \] \[ := \texttt{SUBSTR} \]

referenced by:
- \texttt{functionExpression}

\textbf{sys_context:}

Text value of a parameter associated with a context.

Parameters:
- context: a namespace.
- parameter: name of the parameter.

Solely the namespace USERENV is available with the following parameter names:
- APPLICATION_VERSION: version of the client application.
- APPLICATION_FULL: name and version of the client application.
- APPLICATION_BUILD_EXPIRATION_DATE: build expiration date of the client application.
- AUTHENTICATION_METHOD: current authentication method.
- CLIENT_IP_ADDRESS_INTERNAL: internal IP address of the client device.
- CLIENT_IP_ADDRESS_EXTERNAL: external IP address of the client device.
- CLIENT_LOGICAL_CORE_COUNT: number of logical processor cores in the client device.
- CLIENT_MACHINE_NAME: machine name of the client device.
- CLIENT_SYSTEM_64_BIT: whether the OS is 64-bit on the client device.
- CLIENT_SYSTEM_NAME: full OS name running on the client device.
- CLIENT_SYSTEM_DIRECTORY: system directory of the client device.
- CLIENT_SYSTEM_PAGE_SIZE: system page size of the client device.
- CLIENT_VIRTUAL_MACHINE: whether the client device is a virtual machine.
- CLR_VERSION_BUILD: build version of the Common Language Runtime.
- CLR_VERSION_MAJOR: major version of the Common Language Runtime.
- CLR_VERSION_MAJOR_REVISION: major revision of the Common Language Runtime.
• CLR_ENUMERATION_MINOR: minor version of the Common Language Runtime.
• CLR_ENUMERATION_MIN_REVISION: minor revision of the Common Language Runtime.
• COMPANY_ID: ID of the company of current user.
• COMPANY_NAME: name of the company of current user.
• COMPANY_PHONE: phone of the company of current user.
• COMPANY_WEB_SITE: web site of the company of current user.
• DATA_CONTAINER_ALIAS: alias of active data container.
• DATA_CONTAINER_ID: ID of active data container.
• DATABASE_DESCRIPTION: description of database.
• DATABASE_FULL_NAME: full name of database.
• DATABASE_VERSION: version of database.
• LANG: ISO abbreviation for the language name of the user. Alternative:
  USER_LANGUAGE_CODE.
• MODULE: name of the client application. Alternative: APPLICATION_NAME.
• PROCESS_64_BIT: whether the OS process on the client device runs as 64-bit.
• PROCESS_COMMAND_LINE: command line used to start the OS process.
• PROCESS_CURRENT_DIRECTORY: current directory of the OS process.
• PROCESS_STACK_TRACE: current stack trace of the OS process.
• PROCESS_WORKING_SET: working set of the OS process.
• PROVIDER_DESCRIPTION: description of active data container.
• PROVIDER_DOCUMENTATION_URL: documentation (URL) of active data container.
• PROVIDER_DOWNLOAD_IMPLEMENTATION_URL: download driver (URL) of active data container.
• PROVIDER_NAME: name of active data container.
• PROVIDER_SHORT_NAME: short name of active data container.
• PROVIDER_TECHNICAL_DOCUMENTATION_URL: technical documentation (URL) of active data container.
• SESSION_USER: log on code of the current user. Alternative: CURRENT_USER.
• SESSIONID: session ID of current session.
• USER_DOMAIN_NAME: Windows domain name of current user.
• USER_EMAIL_ADDRESS: email address of current user.
• USER_FIRST_NAME: first name of current user.
• USER_FULL_NAME: full name of current user.
• USER_GENDER: gender of current user.
• USER_HOME_DIRECTORY: home directory of current user on client device.
• USER_INTERACTIVE: whether the current user works interactive.
• USER_PICTURES_DIRECTORY: pictures directory of current user on client device.
• USERFavorites_DIRECTORY: favorites directory of current user on client device.
• USER_DESKTOP_DIRECTORY: desktop directory of current user on client device.
• USER_DOCUMENTS_DIRECTORY: documents directory of current user on client device.
• USER_PROFILE_DIRECTORY: profile directory of current user on client device.
• USER_LAST_LOG_ON: time of last log on of current user.
• USER_LAST_NAME: last name of current user.
• USER_LINKED_IN: LinkedIn name of current user.
• USER_MIDDLE_NAME: middle name of current user.
• USER_MOBILE_NUMBER: mobile number of current user.
- USER_NATIONALITY: nationality of current user.
- USER_PHONE_NUMBER: phone number of current user.
- USER_PICTURE_URL: picture (URL) of current user.
- USER_SKYPE: Skype name of current user.
- USER_TITLE: title of current user.
- USER_TWITTER: Twitter name of current user.
- USER_WEB_SITE: personal website of current user.

Returns: Value of the parameter in the context namespace. SYS_CONTEXT

```
sys_context ::= SYS_CONTEXT
```

referenced by:
- `functionExpression`

**tan:**

Returns the tangent of the provided angle.

Parameters:
- Input: the angle to get the tangent of.

Returns: A number which represents the tangent of the provided angle. TAN

```
tan ::= TAN
```

referenced by:
- `functionExpression`

**times:**

Multiplies one number by the second number.

Parameters:
- First: a number to multiply.
- Second: a number to multiply with.

Returns: The first number multiplied by the second number. ASTERIX

```
times ::= ASTERIX
```

referenced by:
- `arithmeticExpression`

**translate:**

Translate replaces all occurrences of each character in from_string to its corresponding character in to_string.

Parameters:
- input: The string to replace a sequence of characters with another set of characters.
- from_string: The string that will be searched for in the input.
- to_string: All characters in the from_string will be replaced with the corresponding character in the to_string
Returns: the input with all occurrences of each character in from_string replaced by its corresponding character in to_string. TRANSLATE

\[ \text{translate} \quad ::= \quad \text{TRANSLATE} \]

referenced by:
- \[ \text{functionExpression} \]

**translate_resources:**
Replace all Invantine-style resources ('{res:...}') by their translation in the current language.

Parameters:
- \[ \text{txt} \]: The string to replace resources in.

Returns: the input with all resources replaced by their translation. TRANSLATE_RESOURCES

\[ \text{translate\_resources} \quad ::= \quad \text{TRANSLATE\_RESOURCES} \]

referenced by:
- \[ \text{functionExpression} \]

**trim:**
Trims whitespaces from both sides of the provided string.

Parameters:
- \[ \text{Input} \]: the string from which to trim characters.

Returns: A string trimmed from whitespaces from both sides. TRIM

\[ \text{trim} \quad ::= \quad \text{TRIM} \]

referenced by:
- \[ \text{functionExpression} \]

**trunc:**
Calculates the integral part of a number. Unless an amount of decimals is defined, in which case it calculates to the integer with the amount of decimals or date with the amount of positions.

Parameters:
- \[ \text{Input} \]: A number or datetime to truncate.
- \[ \text{Decimals [optional]} \]: A number to specify how many decimals it may truncate to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The truncated input. TRUNC

\[ \text{trunc} \quad ::= \quad \text{TRUNC} \]

referenced by:
- \[ \text{functionExpression} \]
to_hex:

\[ \text{TO\_HEX} \]

\[ \text{to\_hex} \] \( \text{::=} \) \( \text{TO\_HEX} \)

referenced by:
- functionExpression

unistr:

Converts a text with unicodes to regular characters.

Parameters:
- Input: text with unicodes.

Returns: The input converted to all regular characters.

\[ \text{UNISTR} \]

\[ \text{unistr} \] \( \text{::=} \) \( \text{UNISTR} \)

referenced by:
- functionExpression

upper:

Converts provided string to uppercase.

Parameters:
- Input: the string that will be converted to uppercase.

Returns: A string converted to uppercase.

\[ \text{UPPER} \]

\[ \text{upper} \] \( \text{::=} \) \( \text{UPPER} \)

referenced by:
- functionExpression

urldencode:

Decodes a url.

Parameters:
- Url: url to decode.

Returns: The decoded url.

\[ \text{URLDECODE} \]

\[ \text{urldencode} \] \( \text{::=} \) \( \text{URLDECODE} \)

referenced by:
- functionExpression

urllencode:

Encodes a url.

Parameters:
• Url: url to encode.

Returns: The encoded url. URLENCODE

urlencode ::= URLENCODE

referenced by:
• functionExpression

unix_timestamp:
Get the UNIX epoch time of a date/time.

Parameters:
• Input: A dateTime. Current date/time is used when no value is specified.

Returns: The UNIX epoch time. UNIX_TIMESTAMP

unix_timestamp ::= UNIX_TIMESTAMP

referenced by:
• functionExpression

unzip:

UNZIP unzip ::= UNZIP

referenced by:
• functionExpression

zip:

ZIP zip ::= ZIP

referenced by:
• functionExpression

xmlcomment:
Format a text as an XML comment.

Parameters:
• Input: the input which will be formatted as XML comment.

Returns: A text with the input as XML comment. XMLCOMMENT

xmlcomment ::= XMLCOMMENT

referenced by:
• functionExpression
xmldecode:
Returns the XML decoded input.
Parameters:
  • Input: the input which will be decoded into XML.
Returns: An object which is the XML decoded input. XMLDECODE
  xmldecode
  ::= XMLDECODE

referenced by:
  • functionExpression

xmlencode:
Returns the XML encoded input.
Parameters:
  • Input: the input which will be encoded into XML.
Returns: An object which is the XML encoded input. XMLENCODE
  xmlencode
  ::= XMLENCODE

referenced by:
  • functionExpression

xmlelement:
XMLELEMENT
  xmlelement
  ::= XMLELEMENT

referenced by:
  • functionExpression

xmltransform:
Applies an XSL style sheet to the XML instance.
Parameters:
  • XML: XML type instance to be transformed with the XSL style sheet.
  • Style sheet: The XSL style sheet to apply.
Returns: The XML instance with the style sheet applied to it. XMLTRANSFORM
  xmltransform
  ::= XMLTRANSFORM

referenced by:
  • functionExpression

xmlformat:
Pretty-print xml text.
Parameters:
- `Xml`: xml to pretty-print.

Returns: The pretty-printed XML text. XML_FORMAT

```
xmformat ::= XML_FORMAT
```

referenced by:
- `functionExpression`

**httpget:**

Collects all data from the URL as binary data.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- `URL`: the URL to collect the data from.

Returns: The collected data as a byte array. HTTP_GET

```
httpget ::= HTTP_GET
```

referenced by:
- `functionExpression`

**httpget_text:**

Collects all data from the URL as text.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- `URL`: the URL to collect the data from.
- `Encoding`: the encoding from the data to receive, which is by default UTF8.

Returns: The collected data as text. HTTP_GET_TEXT

```
httpget_text ::= HTTP_GET_TEXT
```

referenced by:
- `functionExpression`

**httppost:**

HTTP_POST

```
httppost ::= HTTP_POST
```

referenced by:
- `functionExpression`
quarter:

Collect the quarter from a date.

Parameters:

- Input: A DateTime.

Returns: The quarter as an integer. 

```
quarter ::= QUARTER
```

referenced by:

```
• functionExpression
```

quote_ident:

```
QUOTE_IDENT
quote_ident ::= QUOTE_IDENT

user:

Gets the user log on code.

Returns: The user log on code.

```
USER
user ::= USER
```

referenced by:

```
• functionExpression
```
year:
Collect the year from a date.
Parameters:
  • Input: A dateTime.
Returns: The year as an integer. YEAR
  year ::= YEAR
referenced by:
  • functionExpression

to_binary:
TO_BINARY
  to_binary ::= TO_BINARY
referenced by:
  • functionExpression

to_char:
Converts a value into text.
Parameters:
  • Input: value to convert.
Returns: The input converted to text. TO_CHAR
  to_char ::= TO_CHAR
referenced by:
  • functionExpression

to_date:
Converts a value into a datetime.
Parameters:
  • Input: value to convert.
Returns: The input converted to a datetime. TO_DATE
  to_date ::= TO_DATE
referenced by:
  • functionExpression

to_guid:
Converts a value into a guid.
Parameters:
  • Input: value to convert.
Returns: The input converted to a guid.

Converts a value into a number.

Parameters:
- Input: value to convert.

Returns: The input converted to a number. TO_GUID

\[
\text{to_guid} ::= \text{TO_GUID}
\]

referenced by:
- functionExpression

\[
\text{to_number} ::= \text{TO_NUMBER}

- identifier

constant:
A constant value with associated data type. The null value is typically associated with the null data type.

stringConstant numericConstant booleanConstant intervalConstant null
constant ::= stringConstant | numericConstant | booleanConstant | intervalConstant | null

referenced by:
  - arithmeticExpression
  - pSqlItemDeclaration

stringConstant:
A constant text value with varchar2 data type.

STRING_C stringConstant ::= STRING_C

  - xmlTableSpec

intervalConstant:
A constant interval value, reflecting the time span between two dates. The string constant consists of an integer number and unit of time, taken from the following list:
  - Millisecond,
  - second,
  - minute,
  - hour,
  - day,
  - week, and
  - year.

The units may be postfixed with an 's' without changing meaning, like 'years'.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Valid interval values are for example: "5 seconds", "20 hours" and "1 year". There is no support for combined intervals such as "30 minutes and 30 seconds".

```
INTERVAL stringConstant
   intervalConstant ::= INTERVAL stringConstant

referenced by:

`booleanConstant`:

true false

```
   booleanConstant ::= true | false

referenced by:
   - alterPersistentCacheSetStatement
   - alterPersistentCacheSetTableOptions
   - constant
   - httpDiskCache
```
null:
The "unknown" value null.

```plaintext
NULL
null::= NULL
```

referenced by:
- `constant`
- `jsonTableSpec`
- `xmlTableSpec`

pSqlBlock:
A PSQL block is a structure to define procedural logic. It can contain both procedural logic as well as SQL statements like "select".

```plaintext
pSqlDeclareSection pSqlBody
pSqlBlock::= pSqlDeclareSection? pSqlBody
```

referenced by:
- `pSqlBlockOrStatement`
- `pSqlStatement`

pSqlDeclareSection:
A PSQL declare section defines one or more local variables, which are available in the block and nested blocks.

```plaintext
DECLARE pSqlDeclaration
pSqlDeclareSection::= DECLARE pSqlDeclaration+
```

referenced by:
- `pSqlBlock`

pSqlDeclaration:
A PSQL declaration.

```plaintext
pSqlItemDeclaration
pSqlDeclaration::= pSqlItemDeclaration
```

referenced by:
- `pSqlDeclareSection`

pSqlItemDeclaration:
An item declaration defines one named variable, based upon data type. The initial value can be added as a constant.

```
variableName dataType ASSIGNMENT_OPERATOR constant BATCHSEPARATOR
```

Referenced by:
- `pSqlDeclaration` [123]

### pSqlBody:

A PSQL body contains the procedural logic as well as SQL statements. Variables must have been declared beforehand.

```
BEGIN pSqlStatement END BATCHSEPARATOR
```

Referenced by:
- `pSqlBlock` [123]

### pSqlStatement:

A number of basic PSQL statements are available.

```
pSqlAssignmentStatement pSqlExecuteImmediateStatement pSqlIfStatement
pSqlLoopStatement pSqlNullStatement pSqlBlock sqlStatement BATCHSEPARATOR
```

Referenced by:
- `pSqlBlockOrStatement` [123]
- `pSqlBody` [123]
- `sqlOrPSqlStatement` [37]

### pSqlBlockOrStatement:

A PSQL block or statement defines a procedural step or a SQL statement to be executed.

```
pSqlBlock pSqlStatement
```

Referenced by:
- `pSqlBlockOrStatements` [124]
**pSqlBlockOrStatements:**

\[
pSqlBlockOrStatement \::= pSqlBlockOrStatements +
\]

referenced by:

- `pSqlElseIfExpression`
- `pSqlForNumberLoopStatement`
- `pSqlForRecordLoopStatement`
- `pSqlIfStatement`
- `pSqlWhileLoopStatement`

**pSqlNullStatement:**

The null-statement is a NOP-statement (No Operator). The use of the null-statement is necessary when a PSQL statement is needed, but no activity needs to be performed such as with an if statement. The null-statement also makes explicit that a developer has considered the actions needed and found that no action applies to a specific scenario. This leads to improved code documentation.

\[
\text{NULL BATCHSEPARATOR}
\]

\[
pSqlNullStatement \::= \text{NULL BATCHSEPARATOR}
\]

referenced by:

- `pSqlStatement`

**pSqlAssignmentStatement:**

The assignment statement assign a new value to a variable. To assign the results of a SQL query to a value, use a select ... into ... statement.

\[
\text{variableName ASSIGNMENT_OPERATOR expression BATCHSEPARATOR}
\]

\[
pSqlAssignmentStatement \::= \text{variableName ASSIGNMENT_OPERATOR expression BATCHSEPARATOR}
\]

referenced by:

- `pSqlStatement`

**pSqlExecuteImmediateStatement:**

The execute immediate PSQL statement enables the use of SQL statements that are compiled at runtime. For instance dynamic DDL statements can not always be executed on compiled time and the execute immediate enables these.

\[
\text{EXECUTE IMMEDIATE expression BATCHSEPARATOR}
\]

\[
pSqlExecuteImmediateStatement \::= \text{EXECUTE IMMEDIATE expression BATCHSEPARATOR}
\]
pSqlIfStatement:
The if-statement performs conditional logic. When the boolean expression after if holds, the
PSQL block after the 'then' will be executed. Other branches can be specified using an elsif.
Otherwise, and only when specified, the logic after the else is executed.

```sql
IF booleanExpression THEN pSqlBlockOrStatements pSqlElseIfExpression ELSE pSqlBlockOrStatements END IF
```

---

pSqlElseIfExpression:
ELSIF booleanExpression THEN pSqlBlockOrStatements

```sql
ELSIF booleanExpression THEN pSqlBlockOrStatements
```

---

pSqlLoopStatement:
A variety of PSQL statements for loops are available.

```sql
pSqlForNumberLoopStatement pSqlForRecordLoopStatement pSqlWhileLoopStatement
```

---

pSqlForNumberLoopStatement:
This PSQL integer loop statement iterates over a range of integer values, executing PSQL
statements for each iterated value. The iterations goes from the first value to the last value in
increments of 1. The iterations go backward in decrements of 1 when 'reverse' is specified.

```sql
FOR variableName IN REVERSE numericConstant variableName DOT DOT numericConstant variableName LOOP pSqlBlockOrStatements END LOOP
```

---

pSqlForNumberLoopStatement:

::= FOR variableName IN REVERSE? ( numericConstant | variableName ) DOT DOT ( numericConstant | variableName ) LOOP pSqlBlockOrStatements END LOOP

BATCHSEPARATOR

referenced by:
  • pSqlLoopStatement

pSqlForRecordLoopStatement:

This PSQL result set loop statement iterates over a result set returned by an Invantive SQL query. The PSQL statements are executed for each record. The record's specific values can be retrieved using the variable.

FOR variableName IN PARENTHESES_OPEN selectStatement PARENTHESES_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

::= FOR variableName IN PARENTHESES_OPEN selectStatement PARENTHESES_CLOSE LOOP pSqlBlockOrStatements END LOOP

BATCHSEPARATOR

referenced by:
  • pSqlLoopStatement

pSqlWhileLoopStatement:

This PSQL while loop statement executes PSQL statements as long as the specified boolean condition evaluates to true at loop end.

WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

::= WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP

3.2 Providers

The providers described here are available on all platforms.

3.2.1 Provider Atom10

Atom version 1.0.

Code for use in settings.xml: Atom10

Alias: atom

Status: Production

Available in Editions: Paid, Open Data, Community

3.2.2 Provider AutoTask

AutoTask service management.

Code for use in settings.xml: AutoTask

Alias: autotask

Status: Non-production

Available in Editions: Paid

Non-technical Documentation: http://severa.visma.com

3.2.3 Provider CbsNl

Centraal Bureau voor de Statistiek.

Code for use in settings.xml: CbsNl

Alias: cbsnl

Status: Production

Available in Editions: Paid, Open Data, Community

Provider Attributes

The following provider attributes are available for CbsNl:

<table>

### 3.2.6 Provider DataDictionary

Invantive SQL data dictionary.  

Code for use in settings.xml: DataDictionary
Connector Attributes

The Data Dictionary connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-bytes</td>
<td>Approximate maximum size in bytes of batch when bulk inserting</td>
<td>10000000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per batch when bulk inserting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>connection-string</td>
<td>The connection string for the backing database</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-compression-level</td>
<td>Compression level for the HTTP disk cache, ranging from 1 (little) to 9 (intense). Default is 5.</td>
<td>5</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

3.2.13 Provider ExactOnlineAll

Exact Online (XML, REST and undocumented).

Code for use in settings.xml: ExactOnlineAll

Alias: eol

Abbreviation: eol

Status: Production

Available in Editions: Paid
String-comparison is Case-sensitive: true
Use Catalog in Full Name: true
Use Schema in Full Name: true
Partition Column: division

Updated: 02-12-2019 15:47 using Invantive SQL version 17.33.216-BETA+2512.
Technical Documentation: https://developers.exactonline.com

**Provider Attributes**

The following provider attributes are available for ExactOnlineAll:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from</th>
<th>Set from</th>
<th>Set from</th>
<th>Set from</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>Connection String</td>
<td>Set SQL-Statement</td>
<td>Providers File</td>
<td>Log On</td>
</tr>
<tr>
<td>api-client-id</td>
<td>The client ID is a unique identifier of your application. It is generated by registering an application.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>api-client-secret</td>
<td>The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>api-refresh-token</td>
<td>Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>api-redirect-url</td>
<td>The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>totp-secret</td>
<td>Shared secret key to generate one-time password using TOTP RFC 6238. For improved security, manually enter the one-time password asked during login.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>api-token-url</td>
<td>The token URI is the OAuth2 endpoint to exchange tokens.</td>
<td></td>
<td>✓</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>api-url</td>
<td>URL to access the API.</td>
<td></td>
<td>✓</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>bulk-insert-page-size-bytes</td>
<td>Approximate maximum size in bytes of batch when bulk inserting</td>

### 3.2.16 Provider Freshdesk

Freshdesk, customer happiness for exceptional customer service.

Code for use in settings.xml: Freshdesk

Alias: freshdesk
Status: Production
Available in Editions: Paid

Documentation

Authentication

Authentication can be done using one of the following two alternatives:

1. Using the user log on code, password and company also used on the Freshdesk website.
2. Using an API key and company.

Authentication using user log on code and password is recommended for general use. The company is the name before '.freshdesk.com' in the URL used to log on to Freshdesk in a browser.

The API key can be found in the 'Edit Profile' page in Freshdesk, as described on https://support.freshdesk.com/support/solutions/articles/225435-where-can-i-find-my-api-key.

Usage Limits

Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per hour depends on your Freshdesk plan. The default usage limits vary between 1,000 and 5,000 calls per hour. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Provider Attributes

The following provider attributes are available for Freshdesk:

<table>
<thead>
<tr>

### 3.2.17 Provider Ftp

FTP.

Code for use in settings.xml: Ftp

Alias: ftp

Abbreviation: ftp

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

### Provider Attributes

The following provider attributes are available for Ftp:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Providers File</th>
<th>Set from Log On</th>
</tr>
</thead>

### 3.2.18 Provider GitLab

GitLab version control in the cloud or on-premises.

Code for use in settings.xml: GitLab

Alias: GitLab

Status: Production

Available in Editions: Paid

Technical Documentation: [https://docs.gitlab.com/ee/api/](https://docs.gitlab.com/ee/api/)

Non-technical Documentation: [https://gitlab-apps.com](https://gitlab-apps.com)

### 3.2.19 Provider IbmDb2Udb

IBM DB2/UDB.

Code for use in settings.xml: IbmDb2Udb

Alias: db2

Status: Production

Available in Editions: Paid

Additional Driver to install: [https://support.invantive.com/download-driver-ibm-db2](https://support.invantive.com/download-driver-ibm-db2)

### 3.2.20 Provider InMemoryStorage

Session-specific temporary storage of result sets.

Code for use in settings.xml: InMemoryStorage

Alias: inmem

Status: Production

Available in Editions: Paid

### Code for use in settings.xml: Teamleader

**Alias:** teamleader  
**Abbreviation:** tlr  
**Status:** Production  
**Available in Editions:** Paid  
**String-comparison is Case-sensitive:** true  
**Use Catalog in Full Name:** true  
**Use Schema in Full Name:** true  
**Updated:** 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.  
**Technical Documentation:** [http://apidocs.teamleader.be/](http://apidocs.teamleader.be/)

### Documentation

**Authentication**

Authentication can be done using one of the following two alternatives:

1. Using the user log on code and password also used on the Teamleader website.
2. Using an API group and API secret.

Authentication using user log on code and password is recommended for general use. The user must have access to all functionality since by default all so-called 'scopes' are requested. The scopes can be manually entered to be able to log in with a restricted accounts. Please provide a space-separated list chosen from companies, contacts, deals, departments, events, invoices, products, projects, quotations, subscriptions, tickets, todos, users.

The API group and secret can be found on [https://app.teamleader.eu/apiwebhooks.php?show_key](https://app.teamleader.eu/apiwebhooks.php?show_key).

### Usage Limits
Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per 5 seconds is 25. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

**Custom Fields**

Custom fields for which one value can be entered on an object are added to the table representing the object. For instance, a custom field 'needsaudit' on 'project', will be added as a column 'c_needsaudit' on the 'project' table. The name of the additional column directly derives from the custom field name. Almost all changes, including adding numbers or reading characters, will result in the data model being changed.

Custom fields which can have no, one or multiple values ('set' custom fields) are reflected in the data model by tables with a name constructed of the object name, an underscore plus the name of the custom field. For example, a custom field named 'Multiple Selection' on 'Task' will add a table 'task_multipleselection' to the data model.

Custom fields are unique to each Teamleader environment. When the existence of specific custom field is not guaranteed, please use generic solutions like the tables 'CustomFieldDefinitions', 'custom_fields', 'custom_field_options', 'custom_field', 'Custom_Fields_All', 'Custom_Field_Types' and their object-specific custom field value tables like 'ticket_custom_field_values_by_id'.

**Connector Attributes**

The Teamleader connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>

<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

Client secret must be stored securely since once compromised allows access to your protected resources.

The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.

Use API group authentication when true. OAuth otherwise.

The scope to request an OAuth token for.

The token URI is the OAuth2 endpoint to exchange tokens.

URL to access the API.

</tr>
</tbody>
</table>

3.2.73 Providers

The providers described here are available on all platforms.
3.3 Configuration

3.3.1 Network

The list of available databases is maintained in so-called 'settings.xml' files. These file names all start with 'settings' and end with '.xml'.

Interactive and OS-Applications

A default file 'settings.xml' is placed in the user's home directory folder 'Invantive' during discovery of databases in interactive or OS-applications. Additional settings files may be placed in this folder too.

Web Applications

For web applications, the folder App_Data/Config must contain the settings.xml files. Additional settings files may be placed in this folder too.

Additional Locations

Using the environment variable INVANTIVE_SETTINGS_FILE_PATH, you can specify a different file name and path for the default settings.xml file.

Settings.xml is not searched for at other locations.

Structure

The settings files all have the following structure in XML format; The full specification is available in xsd format and online.

3.3.2 License

The license key controls the availability of functionality, providers and limits of your Invantive products. A license key is associated with a license contract. A license contract has a unique code consisting of a 'L' plus a number. Each license contract can have multiple license keys.
License keys are automatically revoked when they have not been used for three months.
When a license contract concerns a subscription, the contract is automatically ended when it has not been used for three months.

**Interactive and OS-Applications**

For interactive and OS-applications, a file named 'invantive.lic' is searched within the user’s home directory folder 'Invantive'. The license key for use of Invantive products is normally stored within the product’s configuration files after loading it through the user interface of the product.

**Web Applications**

For web applications, a file named 'invantive.lic' is searched within the folder 'App_Data/Config'.

**Additional Locations**

Using the environment variable INVANTIVE_LICENSE_FILE_PATH, you can specify a deviating location for the default license file 'invantive.lic'.

**3.3.3 Logging**

**3.3.3.1 Trace**

During use of the products, a continuous stream of relevant trace messages is being sent to the trace listeners. On Microsoft Windows, you can use the Microsoft program 'dbgview.exe' to see the trace messages.

Trace options are only available when the environment variable 'INVANTIVE_TRACE_ACTIVE' is set to any non-empty value.

The trace messages are also stored in trace files when the environment variable 'INVANTIVE_TRACE_TO_FILE' is set to 'true'.

The default location of the trace files is the folder for temporary files on interactive and OS-applications. The default location for web applications is 'App_Data\Trace'. An alternative folder for trace files can be specified by setting the environment variable 'INVANTIVE_TRACE_FOLDER'.

A limited amount of information is sent to the trace when an error occurs. The call stack and the natural key can be sent to trace by setting the environment variable 'INVANTIVE_TRACE_OWN_EXCEPTION_DETAILS' to 'true'.

**Log to Amazon CloudWatch**

The trace can be logged to Amazon CloudWatch by configuring the following environment variables:

- `INVANTIVE_TRACE_TO_CLOUDWATCH`: change to True to activate logging to CloudWatch
- `INVANTIVE_TRACE_CLOUDWATCH_ACCESS_KEY`: the access key as generated on Amazon.
- `INVANTIVE_TRACE_CLOUDWATCH_SECRET_KEY`: the corresponding secret key.
- `INVANTIVE_TRACE_CLOUDWATCH_REGION`: the geographical region to log the messages.
invantive Trace CloudWatch Group: the log group to use for logging.

The identity associated with the access key must allow logging to CloudWatch.

Amazon CloudWatch logging is rate limited. Messages may not be logged during periods of intensive activity.

The log format is JSON-based as shown:

Microsoft Power BI

When used in combination with Microsoft Power BI, please note that Power BI tries to disable all trace logging by third party drivers. Invantive SQL has limited tracing available through Power BI. To activate: in Power BI go to 'Options and Settings', then 'Options' and choose 'Diagnostics' in the Global group. Place a checkmark next to 'Enable tracing'. This setting will remain effective till you restart Microsoft Power BI.

Direct Trace

Trace messages generated by Invantive can also be logged to file outside the Microsoft .NET trace mechanism. This is called "direct trace".

The advantages of direct trace are:

- Direct trace starts very early in program execution, even before the normal trace mechanism is activates. It therefore allows analysis of start-up problems.
- Direct trace works independent of the normal trace mechanism. It is therefore available even when the environment manages Microsoft .NET trace, such as with Power BI.

The disadvantages of direct trace are:

- The use of direct trace reduces performance significantly. Therefore only enable direct trace when needed.

To activate direct trace, please set the environment variable 'INVANTIVE_DIRECT_TRACE_FILE_PATH' to the file path of the intended log file.

It is recommended to include the placeholder '{PID}' in the file name when you expect to run multiple OS-processes with direct trace.

A commonly used setting for INVANTIVE_DIRECT_TRACE_FILE_PATH is c:\temp\invantive-direct-trace-{PID}.log.
Mac OSX and Linux

Set the environment variable `COMPlus_DebugWriteToStdErr` to write trace messages to the console of Microsoft .NET Core applications:

```bash
export COMPlus_DebugWriteToStdErr=1
```

Note that the Microsoft .NET Core implementation on Mac OSX and Linux are restrained in the default stack size. On `StackOverflowException` such as with Exact Online, please increase stacksize first using:

```bash
export COMPlus_DefaultStackSize=10000000
```

3.3.3.2 Execution Log

Every completed execution of an Invantive product appends an entry to the local execution log. The execution log is in XML-format and located by default at `%USERPROFILE\executionlog.xml`.

The name and location of the execution log can be altered by placing the full path and file name in the environment variable `INVANTIVE_EXECUTION_LOG_FILE`.

The root tag `EXECUTIONLOGS` contains an `EXECUTIONLOG` for every execution once finished. The following elements are available:

- **VERSION**: the record format, always '1'.
- **MESSAGEUID**: the UID of the message as registered on Invantive Cloud.
- **IID**: the Invantive Installation ID of the device.
- **SESSIONID**: the ID of the session.
- **LICENSECODE**: the code of the subscription contract.
- **LICENSEKEYID**: the numeric ID of the license key.
- **MACHINENAME**: the name of the device.
- **EXECUTABLENAME**: the name and path of the executable.
- **APPLICATIONNAME**: the name of the Invantive application.
- **APPLICATIONVERSION**: the version of the Invantive application.
- **USERNAME**: the name of the operating system user.
- **PROCESSID**: the ID of the OS process.
- **STARTTIMEUTC**: the start time of the process (UTC).
- **ENDTIMEUTC**: the end time of the process (UTC).
- **EXITCODE**: the exit code of the process.
- **EXITLEVEL**: the textual description of the exit code.
- **EXITMESSAGECODE**: the message code associated with the execution exit.
- **ISHEADLESS**: whether the process ran headless.
- **COMPUTERMANUFACTURER**: the name of the device’s manufacturer.
- COMPUTERMODEL: the model of the device.
- OSVERSION: the version of the operating system.
- PHYSICALMEMORYINBYTES: the number of bytes in the physical memory.

### 3.3.4 Debugging

Invantive software products contain a number of features to aid analysis of problems.

#### 3.3.4.1 Translations

During use of the products, the user interface is adapted to the user interface language based upon the environment.

The translation involves replacing so-called "resource codes" by their translation.

The translation can be disabled by setting the environment variable 'INVANTIVE_NO_TRANSLATE' to a non-empty value.

### 4 Invantive SQL for Windows

The Windows-specific features of Invantive SQL are documented in this section.

#### 4.1 Internal Consistency Checks

Invantive SQL executes many internal consistency to ensure correctness of the results. Some of these consistency checks are only done during testing phases for reasons such as performance. These checks are automatically checked on testing environments and excluded on production environments.

However, during test or production use you can explicitly disable or enable these checks by setting environment variables to the value 'true' or 'false'. The checks can individually be disabled or enabled, or all together.

To explicitly enable all consistency checks, set the environment variable `INVANTIVE_CHECK_ALL` to true. To explicitly disable all consistency checks, set the environment variable `INVANTIVE_CHECK_ALL` to false.

First determine with help of support the message code to explicitly enable or disable a consistency check. Then set the environment variable `INVANTIVE_CHECK_<message code>` to the correct value.

### 5 Contact Information

Invantive® BV is distributor of software solutions owned by Invantive® Software BV.

Security incidents
Security incidents: +31 88 00 26 598
Email: security@invantive.com
Opening hours: 9:00 - 17:00 CET Monday to Friday

Always include your telephone number, your e-mail address and a short description. Please do not give sensitive details until a secure communication channel has been established.

For urgent security incidents please send both an email outside of opening hours and call with number display on. You will be called back as soon as possible.

We use the threat matrix of NCSC to classify a reported incident. We use the Responsible Disclosure Guideline of NCSC as basis for our policy.

You will always receive a confirmation of receipt within 1 working day.

We ask you not to share information about the security incident with others until Invantive has had sufficient opportunity to resolve the problem and users have had sufficient opportunity to use a possibly updated version of the software. We ask you to not further use any knowledge of the security incident and to omit any actions made possible after the existence of the security problem.

If you are not satisfied with the handling, we would like to ask you to contact the NCSC.
