1 Invantive Control for Excel

De doelgroepen voor de handleiding van Invantive Control for Excel zijn ontwikkelaars en gebruikers van een rekenmodel. De voordelen van Invantive Control for Excel zijn:

- Gebruik van veelgebruikte Microsoft Excel;
- Gebruik Invantive Producer applicaties, zoals Invantive Control for Excel;
- Synergie tussen Microsoft Excel en Invantive Control for Excel door eenvoudig opvragen en bewerken gegevens;
- Compliance met ISO 27002 met Excel.

1.1 Snelle Configuratie

Als je dit stappenplan volgt, kun je snel aan de slag met Invantive Control for Excel.

Voer de volgende stappen uit:

- Controleer dat op je werkplek de drivers geïnstalleerd zijn om de database te kunnen benaderen. Voor Microsoft SQL Server zijn drivers altijd al aanwezig. Voor andere database platformen vind je hier uitleg hoe je de installatie uitvoert.

- Als vanaf meerdere werkplekken verbindingen opgebouwd worden, dan kan het raadzaam zijn om de Invantive Web Service te gebruiken, want dan hoef je geen drivers te installe ren op alle werkplekken.

- Dubbelklik op het setup.exe bestand.

- Klik op de 'Install' knop als onderstaand venster verschijnt:

- De installatie wordt nu uitgevoerd.

- Invantive Control for Excel start samen met Microsoft Excel. Je kunt het dus alleen starten door Microsoft Excel op te starten.

- Bij de eerste keer starten van Microsoft Excel na de installatie verschijnt het configuratievenster. Het configuratievenster verschijnt ook als je de Ctrl-toets ingedrukt houdt bij het starten van Microsoft Word.

- Start Notepad via het Windows Start menu.

- Maak een leeg bestand settings.xml en bewaar dit bijvoorbeeld op je bureaublad.

In het settings.xml bestand definieer je de database verbinding die je wilt gaan gebruiken.

Als je hierbij hulp nodig hebt, dan kun je voor gratis hulp bellen met Invantive Support op +31 88 00 26 599, een e-mail sturen naar support@invantive.com of http://support.invantive.com bezoeken.

Kies jouw settings.xml in het configuratievenster.

Druk op OK.

Je komt nu in het aanmeldvenster.

Kies de verbinding die je wilt gebruiken.

Vul de gebruikersnaam in.

Vul het wachtwoord in.

Klik op 'Connect'.

Het aanmeldvenster verdwijnt en afhankelijk van je rechten verschijnen knoppen in de linten Invantive Control en Modelleur.

Lees in Aan de slag hoe je met kunt werken met Invantive Control for Excel.

1.2 Aan de slag
Hier leer je hoe je Invantive Control for Excel snel voor het eerst kunt gebruiken.
Na de Snelle Configuratie kom je in Microsoft Excel.
Er zijn geen verdere instructies.

1.3 Beschrijving
Dit hoofdstuk bestaat uit een beschrijving van het concept, de werking, en de toepassingsgebieden van Invantive Control for Excel.

1.3.1 Concept
Invantive Control for Excel kent de volgende concepten:

- Model;
- Blok;
- Parameter;
- Uitbreiding;
- Openstaande wijziging;
- Synchroniseren.

De afbeelding toont een overzicht van de concepten en de relaties tussen de concepten.
## Model

## Blok

Een blok is een aangrenzend gebied in een Excel werkblad. Een blok bevat gegevens van een database opgehaald door een query bij de laatste synchronisatie en het bevat de gegevens die nog weggeschreven moet worden bij de volgende synchronisatie. Een blok loopt over één van de dimensies: cel, kolom, rij of werkblad. Zie Blokken voor een voorbeeld.

## Parameter

Een parameter is een filter dat ingesteld kan worden om een gedeelte van de gegevens van een blok op te halen uit de feitendatabase. Met het opgeven van een parameter zorg je ervoor dat alleen gegevens uit de database wordt opgehaald die in het filter ingesteld zijn. Zie Parameterwaarden voor het instellen van parameters.

## Uitbreiding

Een uitbreiding is een geïntegreerd script in het uitvoerproces van het model. Een uitbreiding verrijkt een Model met de functionaliteit die niet standaard zit in Invantive Control for Excel. Een voorbeeld van een uitbreiding is om door middel van een knop geautomatiseerd gegevens toe te voegen in het werkblad. Zie Uitbreidingen voor meer informatie.

## Openstaande wijziging

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Dit zijn wijzigingen in de lokale gegevens van de modelgebruiker en staan klaar om gestuurd te worden naar de feitendatabase. De feitendatabase bevat de centrale opslag van feiten buiten een Excel werkblad. Een openstaande wijziging kan bijvoorbeeld een aanpassing zijn van een celwaarde in Excel en deze wijziging moet nog naar de feitendatabase gestuurd worden. Zie Openstaande Wijzigingen voor meer informatie.

Synchroniseren

Synchroniseren gebruik je om openstaande wijzigingen naar de feitendatabase te verzenden en om de nieuwste gegevens uit de feitendatabase op te halen. Via de optie uploaden worden de wijzigingen die nog niet verzonden zijn naar de feitendatabase verstuurd. Via de optie downloaden worden laatste gegevens opgehaald uit de feitendatabase en verwerkt in het blok met gegevens. Zie Gebruikersinterface Modelgebruiker voor meer informatie.

1.3.2 Werking

1.3.3 Toepassingsgebied

Deze paragraaf bevat de toepassingsgebieden voor Invantive Control for Excel. De toepassingsgebieden bestaan uit de ondersteuning voor rekenmodellen, offline werken en het beheer van gegevens.

1.3.3.1 Rekenmodel

Een rekenmodel is een rekenkundig model en aan de hand van het model kunnen berekeningen worden uitgevoerd. Een voorbeeld van een rekenmodel is een kosten-batenanalyse en hiermee kunnen de verwachte kosten worden afgewogen ten opzichte van de te verwachte baten. De analyse wordt gebruikt om de winstgevendheid te bepalen van onder andere een product, project of dienst.

**Voorbeeld rekenmodel in Invantive Control for Excel**

De figuur laat een voorbeeld zien van een kosten-batenanalyse voor de ontwikkeling van een product die gebaseerd is op drie verschillende aanpakken. Per aanpak zijn verschillende kostprijzen en verkoopprijzen gehanteerd en uit de staafdiagram blijkt dat Aanpak 3 de meeste winst oplevert. De berekeningen in het model zijn opgeslagen in de database, zodat de uitkomsten na synchronisatie worden getoond door middel van Invantive Control for Excel in Excel. Het voordeel is dat de gebruiker de berekeningen niet (per ongeluk) kan aanpassen en een ander voordeel is dat berekeningen kunnen worden beheerd.

1.3.3.2 Offline Werken

Invantive Control for Excel kun je gebruiken om offline gegevens te bewerken in Excel. Met offline werken kun je zonder verbinding met een database gegevens invoeren, wijzigen en verwijderen in de werkmap. Als er weer een verbinding beschikbaar is met de database kun je de wijzigingen weer terugsturen en ophalen (synchroniseren) met de database.

1.3.3.3 Beheer van Gegevens

Een ander voorbeeld om Invantive Control for Excel te gebruiken is voor het beheer van gegevens voor het invoeren en bijwerken van grote blokken gegevens. Een voorbeeld hiervan is om CRM-gegevens te wijzigen zoals organisaties en personen, zie hiervoor de afbeelding. Het is mogelijk om meerdere organisaties en personen te wijzigen en dit weer te synchroniseren met de database.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
1.4 Functionaliteit
Deze paragraaf bevat de systeemeisen, de installatiestappen en de uitleg van de gebruikersinterface van Invantive Control for Excel.

1.4.1 Systeemeisen
Om Invantive Control for Excel te kunnen gebruiken op je PC of terminal server heb je de volgende programmatuur nodig inclusief licenties:
- Microsoft Office 2010 of Microsoft Office 2013 (alleen op Microsoft Windows).
- Microsoft .NET 4.5.
- Microsoft Windows 7, 8 of 8.1.
- Minimaal 2 Gb intern geheugen.
- Schermresolutie van 1280x1024 of hoger.
- Gebruikerslicentie gebruikte databases en/of bedrijfsapplicaties.
- Invantive Web Service of lokale drivers.

Gebruik op Mac, tablet en smartphone is niet mogelijk.

1.4.2 Installeren Excel Add-in
Invantive Control for Excel wordt geïnstalleerd op de Windows-computer door de volgende stappen uit te voeren:
- Voer het installatiebestand 'setup.exe' uit en klik vervolgens op de knop 'Install'. Het bestand staat in de map van Invantive Control for Excel. Deze installatiemap wordt aangeleverd door Invantive.
Als de installatie gelukt is verschijnt het onderstaande scherm.

Microsoft Office Customization Installer
Publisher has been verified
Are you sure you want to install this customization?

Name: Invantive Control
Publisher: Invantive B.V.

While Office customizations from the Internet can be useful, they can potentially harm your computer. If you do not trust the source, do not install this software. More Information...

Install     Don't install

Klik op het tabblad 'Invantive Control for Excel' in het lint en klik vervolgens op de knop 'Verbinden' om een verbinding op te zetten naar de server. Geef gebruikersnaam, wachtwoord en verbinding op en klik op 'OK', zie Verbinding voor de uitgebreidere uitleg.
1.4.3 Gebruikersinterface Modelgebruiker

Document Management
De groep 'Document Management' bevat de volgende knop:

- Open Sjabloon vanuit DMS: Open een pop-up om documenten vanuit het DMS van Invantive Producer te openen, zie Open Sjabloon vanuit DMS.

Synchroniseren

De groep 'Synchroniseren' bevat de volgende knoppen:

- Sync: Synchroniseer de modelwerkmap met de feitendatabase. Download alle nieuwe feiten en upload de wijzigingen naar de feitendatabase. Onder de knop 'Sync' zitten de volgende functies:
  - Alleen Uploaden: Upload de wijzigingen van het huidige modelwerkblad naar de feitendatabase.
  - Alleen Downloaden: Download alle nieuwe feiten van de feitendatabase in het huidige model.
  - Publiceer naar Nieuw Model: Publiceer het model naar een nieuw bestand, met alleen het model zonder de feiten.
- Openstaande Wijzigingen: Toon de openstaande wijzigingen die nog niet gesynchroniseerd zijn met de feitendatabase. Het cijfer tussen haken toont het aantal wijzigingen die nog niet gesynchroniseerd zijn, zie Openstaande Wijzigingen.

Publiceren

De groep 'Publiceren' bevat de volgende knop:

- Publiceer: Publiceer de inhoud van dit Excel-werkblad naar een nieuw werkblad. U kunt vertrouwelijke gegevens van het originele werkblad uitsluiten van het nieuwe werkblad, zie Publiceer.
Modelinformatie

De groep 'Modelinformatie' bevat de volgende knoppen:
- Modelinformatie: De eerste regel toont de naam en versie van het model en de tweede regel de auteur en het bedrijf.
- Parameterwaarden: Open het parameterscherm om een filter in te stellen voor het ophalen van gegevens in de werkmap, zie Parameterwaarden.

Blokacties

De groep 'Blokacties' bevat de volgende knoppen:
- Toevoegen Rij: Voeg een nieuwe rij toe na de huidige rij in het geselecteerde blok.
- Verwijderen Rij: Verwijder de geselecteerde rij van het huidige blok.

Veldacties

De groep 'Veldacties' bevat de volgende knop:
- Kies een Waarde: Open een pop-up waarin ., zie Kies een Waarde.

Verbinding

De groep 'Verbinding' bevat de volgende knoppen:
- Verbinden: Verbind naar een feitendatabase. Als er een verbinding is met de database toont de knop de gebruikersnaam en de server, zie Verbinding. Onder de knop 'Verbinden' zit de volgende functie:
  - Configuratie: Configureer de instellingen van Invantive Control for Excel, zie Configuratie.
Voorkeuren: Configureer uw persoonlijke voorkeuren voor de Invantive Control for Excel, zie Voorkeuren.

Help

De groep 'Help' bevat de volgende knop:
- Help: Krijg hulp voor het gebruik van Invantive Control for Excel, zie Help.

1.4.3.1 Open Sjabloon vanuit DMS

Voer hier tekst in.

1.4.3.2 Openstaande Wijzigingen

De knop 'Openstaande Wijzigingen' toont alle wijzigingen die gemaakt zijn in Excel en nog niet gesynchroniseerd zijn met de feitendatabase.
1.4.3.3 Publiceer

De functie 'Publiceer' maakt een nieuw Excelwerkblad met een kopie van gegevens uit het originele Excelbestand. In het venster selecteert u de elementen die overgenomen dienen te worden naar een nieuw werkblad.

![Publish dialog box]

### 1.4.3.4 Parameterwaarden

De knop 'Parameterwaarden' toont de parameters die ingesteld zijn in de Modelbewerker. De huidige waarde kan bewerkt worden om een andere deel te tonen van de gegevens in het model. In de afbeelding worden alleen de organisaties getoond die beginnen met de letter 'A'.

![Bewerking Parameterwaarden]

<table>
<thead>
<tr>
<th>Code</th>
<th>Omschrijving</th>
<th>Standaard Waarde</th>
<th>Huidige Waarde</th>
</tr>
</thead>
<tbody>
<tr>
<td>organisatiename</td>
<td>Organisatiename</td>
<td></td>
<td>A2</td>
</tr>
</tbody>
</table>
1.4.3.5 Kies een Waarde

De afbeelding toont het venster waar de verbinding naar de database wordt opgegeven.

1.4.3.6 Verbinding

De afbeelding toont het venster waar de verbinding naar de database wordt opgegeven.
De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Beschrijving</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gebruikersnaam</td>
<td>Dit is de gebruikersnaam om verbinding te maken naar de server.</td>
</tr>
<tr>
<td>Wachtwoord</td>
<td>Hier staat het bijbehorende wachtwoord van de gebruiker.</td>
</tr>
<tr>
<td>Verbinding</td>
<td>Geef hier de server op waarmee u verbinding wilt maken.</td>
</tr>
<tr>
<td>Bewaar wachtwoord</td>
<td>Indien aangevinkt wordt het wachtwoord versleuteld opgeslagen.</td>
</tr>
<tr>
<td>Automatisch verbinden</td>
<td>Indien aangevinkt wordt automatisch verbinding gemaakt met de server en verschijnt het verbindingsscherm niet.</td>
</tr>
</tbody>
</table>

1.4.3.7 Configuratie

In dit venster stelt u de configuratie van Invantive Control for Excel.
De betekenis van de velden in het tabblad 'Algemeen' is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Beschrijving</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gebruik Invantive Control for Excel</td>
<td>Indien aangevinkt is het mogelijk om Invantive Control for Excel te activeren.</td>
</tr>
<tr>
<td>Ontwikkellmodus</td>
<td>Indien aangevinkt wordt het tabblad Modeller zichtbaar in het lint. Deze optie is alleen nodig voor een modelontwikkelaar.</td>
</tr>
<tr>
<td>Haal instellingen op uit</td>
<td>Hierin staat de bestandslocatie van het XML-bestand met de verbindingsopties.</td>
</tr>
<tr>
<td>Aantal beschikbare verbindingen</td>
<td>Dit veld geeft het aantal beschikbare verbindingen aan naar databases.</td>
</tr>
</tbody>
</table>
De betekenis van de velden in het tabblad 'Geavanceerd' is:

**Installatielocatie:** Hierin staat de locatie van het installatiebestand van Invantive Control for Excel. Bij het opstarten van Excel wordt op deze locatie gecontroleerd of een nieuwere versie beschikbaar is van Invantive Control for Excel. Als er een nieuwere versie beschikbaar is, verschijnt de vraag of je deze wilt installeren.

**Doelmap installatie:** Dit geeft de lokale bestandslocatie aan van Invantive Control for Excel waar het programma opgeslagen is.

**Configuratiefbestand:** Dit is de bestandslocatie van het lokale configuratiebestand waarin de instellingen staan.

**Enable debug mode:** Indien aangevinkt is het tabblad Modeller beschikbaar, zie Gebruikersinterface Modeller [link]. Deze optie mag alleen aangevinkt worden op verzoek van Invantive.

### 1.4.3.8 Voorkeuren

In dit venster stelt u de voorkeuren van Invantive Control for Excel in.
De betekenis van de velden in het tabblad Filter is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Betekenis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jouw naam</td>
<td>Dit geeft de naam van de gebruiker aan binnen Invantive Producer.</td>
</tr>
<tr>
<td>Rapportagedatum</td>
<td>Je kunt hier aangeven voor welke peildatum de gegevens op de rapportages getoond moeten worden. Deze datum wordt geactiveerd door de selectievalje aan te vinken.</td>
</tr>
</tbody>
</table>
De betekenis van het veld in het tabblad Voorkeuren is:

**Taal**

Hierin staan de talen die beschikbaar zijn in Invantive Control for Excel. De taalwisseling wordt direct na het sluiten van het venster toegepast.

**1.4.3.9 Help**

De knop 'Help' laat de helpfunctie zien van Invantive Control for Excel inclusief die van Invantive Control for Excel.
1.4.4 Gebruikersinterface Modelontwikkelaar

Deze paragraaf bevat de uitleg hoe een modelontwikkelaar Invantive Control for Excel kan gebruiken aan de hand van de knoppen in het lint in Microsoft Excel. De modelontwikkelaar kan dezelfde functies gebruiken als de modelgebruiker, alleen de ontwikkelaar kan ook het model aanpassen. De volgende afbeelding laat het tabblad ‘Modeller’ zien met de knoppen die de modelontwikkelaar kan gebruiken. Deze paragraaf geeft per knop de werking aan.

Model

De groep 'Model' bevat de volgende knoppen:
Ontwerpmodus: schakelt de ontwerpmodus van de werkmap in of uit. Het model kan gewijzigd worden in de ontwerpmodus. Bij inschakelen word gevraagd om een wachtwoord als dit ingesteld is.

Valideer Model: valideert het ontworpen model. Als de validatie mislukt volgt er een foutmelding.

Installeer Database: installeer de modelldatabase in dit werkblad.

Bijwerken Database: upgrade het model van de database van dit werkboek naar de laatste versie die ondersteund wordt door Invantive Control for Excel. De knop werkt alleen als er een update beschikbaar is.

Verwijder Database: verwijder het databasemodel van dit werkblad. Deze actie kan niet ongedaan worden gemaakt en synchroniseren van wijzigingen is hierna niet meer mogelijk.

Tools

De groep 'Tools' bevat de volgende knop:

- Query Tool: opent de Query Tool om een SQL-query op de database uit te voeren, zie Invantive Producer Query-tool.

Blokinformatie

De groep 'Blokinformatie' bevat de volgende knop:

- Blokinformatie: hier wordt de informatie over het geselecteerde blok getoond met hierbij de broncode en of het blok bewerkt mag worden.

Rij-informatie

De groep 'Rij-informatie' bevat de volgende knop:

- Rij-informatie: hier wordt de informatie over de geselecteerde rij getoond met hierbij het unieke ID, status en veld uit de feitendatabase.

Foutopsporing en Analyse
De groep 'Foutopsporing en Analyse' is alleen zichtbaar als de debug mode aanstaat en bevat de volgende knoppen:

- Repository Werkbladen: toont de verborgen werkbladen. De repository bevat een werkmap met de modelldatabase en een leeg werkblad. zie Repository Werkbladen
- Toon Spoor: opent een venster met de foutopsporing en analyse. Dit venster kan gebruikt worden om eventueel fouten in de werking van Invantive Control for Excel te analyseren, zie Toon Spoor
- Markeer Rij als Nieuw: markeer deze rij als nieuws, zodat het kan worden ingevoegd in de feitendatabase bij de volgende synchronisatie. Deze functie kan gebruikt worden bij het kopieren van gegevens tussen twee feitendatabases.

1.4.4.1 Modelbewerker

In de modelbewerker wordt de configuratie van het model opgeslagen, zoals de naam, de versie, de auteur en het wachtwoord. Verder kun je er de parameters, blokken en uitbreidingen invoeren, wijzigen en verwijderen. Ook is er een overzicht van de openstaande wijzigingen. Als er een wachtwoord ingesteld is voor het bewerken van het model wordt er hierom gevraagd bij het klikken op de knop 'Bewerk model', zie afbeelding.

De afbeelding toont het scherm van de modelbewerker.
De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Beteekenis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Naam</td>
<td>De naam van dit model.</td>
</tr>
<tr>
<td>Versie</td>
<td>Het versienummer.</td>
</tr>
<tr>
<td>Auteur</td>
<td>De auteur(s) van het model.</td>
</tr>
<tr>
<td>Wachtwoord toegang</td>
<td>Het wachtwoord voor de beveiliging van het Excel-werkboek.</td>
</tr>
<tr>
<td>Wachtwoord bewerken</td>
<td>Het wachtwoord om het wijzigen van het model te mogen wijzigen of inzien in de modelbewerker.</td>
</tr>
<tr>
<td>Sta wijzigingen buiten blokken toe</td>
<td>Indien aangevinkt kun je wijzigingen buiten de blokken maken.</td>
</tr>
<tr>
<td>Omschrijving</td>
<td>De beschrijving van het model.</td>
</tr>
<tr>

<td>• Server en gebruikersnaam wanneer het model voor het laatste geopend is</td>
</tr>
<tr>
<td></td>
<td>• Server en gebruikersnaam wanneer het model voor het laatst bijgewerkt is</td>
</tr>
</tbody>
</table>

**Blokken**

Een blok is een aaneengesloten gebied in een Excel-werkboek. Een blok bevat gegevens van een database opgehaald door een query bij de laatste synchronisatie en het bevat de
gegevens die nog weggeschreven moet worden bij de volgende synchronisatie. Een blok lo-opt over één van de dimensies: cel, kolom, rij of werkblad. De afbeelding toont de huidige blokken, in dit voorbeeld zijn dit de blokken 'Organisaties' en 'Personen'.

In dit venster kun je een blok toevoegen, aanpassen of verwijderen.

De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Code</th>
<th>De unieke naam van dit blok.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actief</td>
<td>Indien aangevinkt is dit blok actief en kun je dit blok synchroniseren met de feitendatabase.</td>
</tr>
<tr>
<td>Benoem bereik gegevens</td>
<td>Het bereik van gegevens als een unieke naam. Deze naam wordt als benoemd bereik gebruikt in Excel om de data te identificeren van het gehele blok, inclusief randen. De naam kun je vervolgens gebruiken in een Excel-formule.</td>
</tr>
<tr>
<td>Benoem bereik rand</td>
<td>De rand van het benoemd gegevensbereik als een unieke naam. Deze naam wordt als benoemd bereik gebruikt in Excel om het gehele blok te identificeren, inclusief de randen. De naam kun je vervolgens gebruiken in een Excel-formule.</td>
</tr>
</tbody>
</table>
**Oriëntatie en omvang**

- **Kolommen:**
- **Rijen:**

In dit venster kun je de herkomst feiten ingeven van het blok.

De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Betekenis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bedrijfsoject</td>
<td>De naam van het bedrijfsoject, zoals bekend in de feitendatabase. Dit is vaak de naam van een databaseview.</td>
</tr>
<tr>
<td>Primaire sleutel</td>
<td>De primaire sleutel van het bedrijfsoject op. Optioneel wanneer dit blok alleen lezen is.</td>
</tr>
<tr>
<td>Transactiekolom</td>
<td>De transactiekolom van het bedrijfsoject. Dit veld is optioneel wanneer de toegangscontroles toevoegen, bijwerken en verwijderen uit staan.</td>
</tr>
<tr>
<td>Dow nloadvolgorde</td>
<td>De downloadvolgorde van het bedrijfsoject, dit kan één of meerdere nummer en/of letters zijn. Het geeft de downloadvolgorde aan van de blokken naar de database. Een voorbeeld is dat a001 voor b001 komt.</td>
</tr>
<tr>
<td>Uploadvolgorde</td>
<td>De uploadvolgorde aan van het bedrijfsoject, dit kan een combinatie zijn van één of meerdere nummer en/of letters. Dit geeft de uploadvolgorde aan van blokken naar de database. Een voorbeeld is dat a001 voor b001 komt.</td>
</tr>
</tbody>
</table>
Select de kolommen op van het bedrijfsobject. De kolommen moeten gescheiden zijn met een komma.

Filter Definieer een filter om een gedeelte van een blok te selecteren in SQL-syntax.

Volgorde De lijst van kolommen om de gegevensvolgorde te bepalen in SQL-syntax.

Dit venster toont de kolommen van het bedrijfsobject en wordt automatisch gevuld.

De betekenis van de velden zijn:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Betekenis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Naam</td>
<td>De naam van de kolom.</td>
</tr>
<tr>
<td>Datatype</td>
<td>Het datatype van de kolom.</td>
</tr>
<tr>
<td>Synchroniseren Terug</td>
<td>Indien aangevinkt worden aanpassingen in de kolom bijgehouden in de openstaande wijzigingen. De wijzigingen worden bij het synchroniseren naar de feitendatabase verstuurd.</td>
</tr>
<tr>
<td>Formule</td>
<td>Indien aangevinkt kan de kolom een Excelformule bevatten. Hierbij wordt alleen de uitkomst van de formule teruggestuurd naar de feitendatabase bij synchronisatie. Vink het aan als je een formule in Excel wilt gebruiken in deze kolom.</td>
</tr>
<tr>
<td>Read-only</td>
<td>Indien aangevinkt kan de modelgebruiker de kolomwaarden niet aanpassen. De kolomwaarde kan wel door Invantive Control for Excel aangepast worden.</td>
</tr>
<tr>
<td>Standaardwaarde</td>
<td>De waarde wordt pas ingevuld na synchronisatie met de feitendatabase.</td>
</tr>
<tr>
<td>Positie</td>
<td>Dit geeft de positie aan van de kolom in het blok in Excel.</td>
</tr>
<tr>
<td>Lijstbron</td>
<td>De lijst waarin de picklist staat voor de lijst.</td>
</tr>
<tr>
<td>Lijstcodeveld</td>
<td>DB-waarde</td>
</tr>
<tr>
<td>Lijstbeschrijving</td>
<td>Label</td>
</tr>
</tbody>
</table>

Dit venster toont de kolommen van het bedrijfsobject
In dit venster kun je de weergave instellen van het blok.
De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Label Enkelvoud</td>
<td>Geef een naam in enkelvoud voor de opmaak.</td>
</tr>
<tr>
<td>Label Meervoud</td>
<td>Geef een naam op in het meervoud voor het label.</td>
</tr>
</tbody>
</table>

**Startpositie**
- Absoluut:
- Gekoppeld:

**Beperk**

**Randbreedte**
Parameters

In de parameters kun je een filter voor het model opgeven. Met het opgeven van een filter, en het gebruik ervan, zorg je ervoor dat alleen gegevens uit de database wordt opgehaald die in de filter ingesteld zijn. Een parameter kun je gebruiken bij de filtering van een blok, zie Blokken. De afbeelding geeft aan dat de parameter ingesteld is op ‘A%’. Dit betekent dat alleen organisaties die beginnen met de letter ‘A’ worden opgehaald door Invantive Control for Excel.

In dit onderdeel van de modelbewerker kun je de parameters toevoegen, wijzigen en verwijderen.

De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>De unieke naam van de parameter</td>
</tr>
<tr>
<td>Omschrijving</td>
<td>De omschrijving van de parameter</td>
</tr>
<tr>
<td>Standar-waarde</td>
<td>De standar-waarde van de parameter</td>
</tr>
<tr>
<td>Huidige Waarde</td>
<td>De huidige waarde van de parameter</td>
</tr>
</tbody>
</table>

Uitbreidingen

Een uitbreiding is een embedded script in de execution flow van het Model. Een uitbreiding verrijkt een Model met functionaliteit die niet standaard is opgenomen in Invantive Control for Excel. Een voorbeeld van een uitbreiding om door middel van een knop geautomatiseerd gegevens toe te voegen in het werkblad.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
De betekenis van de invulvelden is:

<table>
<thead>
<tr>
<th>Veld</th>
<th>Bijkomende uitleg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>Geef een unieke naam op voor de uitbreiding.</td>
</tr>
<tr>
<td>Laadvolgorde</td>
<td>Geef een nummer op voor de laadvolgorde van de uitbreiding in Invantive Control for Excel.</td>
</tr>
<tr>
<td>Actief</td>
<td>Dit veld geeft een indicatie of de uitbreiding actief is of niet.</td>
</tr>
<tr>
<td>Taal</td>
<td>Geef de programmeertaal op van de uitbreiding.</td>
</tr>
<tr>
<td>Omschrijving</td>
<td>Geef een omschrijving op van de uitbreiding.</td>
</tr>
<tr>
<td>Bestandslocatie</td>
<td>Geef een bestandslocatie op van de locatie van de uitbreiding. Het veld 'Bestandslocatie' of 'Definitie' moet gevuld zijn met respectievelijk de locatie van de uitbreiding of de programmacode.</td>
</tr>
<tr>
<td>Definitie</td>
<td>Geef de programmacode op van de uitbreiding.</td>
</tr>
<tr>
<td>Commentaar</td>
<td>Geef commentaar op de uitbreiding.</td>
</tr>
</tbody>
</table>

**Openstaande Wijzigingen**

Openstaande wijzigingen zijn wijzigingen in de lokale gegevens van de modelgebruiker en staan klaar om gestuurd te worden naar de feitendatabase. De feitendatabase bevat de centrale opslag van feiten buiten een Excel werkblad. Een openstaande wijziging kan bijvoorbeeld een aanpassing zijn van een celwaarde in Excel en deze wijziging moet nog naar de feitendatabase gestuurd worden. Het venster toont de wijzigingen die nog niet met de database gesynchroniseerd zijn.
1.4.4.2 Celreferentie Expressie

De functionaliteit celreferentie expressie heeft als doel om normale celverwijzingen in Microsoft Office Excel dynamisch opslaan in het model. Een celverwijzing verwijst naar een cel of celbereik op een werkblad en kan in een formule worden gebruikt, zodat in Excel kan worden gezocht naar de waarden of gegevens die u met die formule wilt berekenen. Invantive Control for Excel zet in Excel automatisch de vooraf gedefinieerde celreferentie expressie om naar de celreferentie waar Excel mee werkt. In het blok kun je bij een kolom een celreferentie expressie opgeven naar een andere kolom. Na het synchroniseren wordt in de cellen van de kolom (met een celreferentie expressie) een verwijzing gemaakt naar de locatie in Excel waar de expressie naar verwijst.

Celreferentie in Microsoft Office Excel

Een celverwijzing verwijst naar een cel of celbereik op een werkblad en kan in een formule worden gebruikt, zodat in Microsoft Office Excel kan worden gezocht naar de waarden of gegevens die u met die formule wilt berekenen.

In een of meer formules kunt u een celverwijzing gebruiken om te verwijzen naar het volgende:

- Gegevens uit een cel van het werkblad
- Gegevens die zich in andere gebieden van een werkblad bevinden
- Gegevens in cellen van andere werkbladen in dezelfde werkmapi
Voorbeeld:

Deze formule: | Verwijst naar: | En geeft als resultaat:
---|---|---
=C2 | Cel C2 | De waarde in cel C2
=Activa-Passiva | De cellen met de naam Activa en Passiva | De waarde in de cel Passiva afgetrokken van de waarde in de cel Activa
(=Week1+Week2) | Het celbereik met de naam Week1 en Week2 | De som van de waarden van het celbereik met de naam Week1 en Week2 als matrixformule
=Blad2!B2 | Cel B2 op Blad2 | De waarde in cel B2 op Blad2

Doel

Het doel van een celformule expressie is het makkelijk leggen van kruisverbindingen in een model. Het maakt daarbij niet uit of het verband gelegd worden tussen twee cellen in hetzelfde blok, tussen meerdere blokken of zelfs daar buiten.

Voordelen van celformule expressie ten opzichte van Excel formules die dynamisch zelf bepalen welke andere cellen ze moeten gebruiken:

- Hoge verwerkingscapaciteit bij grote hoeveelheden celformules in Excel.
- Verhoogde integriteit van de gegevens doordat de formules eenvoudiger worden.
- Snel en gemakkelijker geavanceerde modellen ontwikkelen.
- Celformule expressies kunnen zowel afkomstig zijn uit de database als in het model vastgelegd worden om zodoende de hoeveelheid benodigde netwerkbandbreedte te beperken voor extreem grote modellen.

Werkwijze

De syntax van een celformule expressie is:

\$C\{Draaimethode, Blok, Werkblad, Kolom 1, Rij 1, Kolom 2, Rij 2\}.

De betekenis van de onderdelen is:

<table>
<thead>
<tr>
<th>Onderdeel</th>
<th>Verplicht</th>
<th>Omschrijving</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draaimethode</td>
<td>Ja</td>
<td>Het begin waar het bereik begint.</td>
</tr>
</tbody>
</table>
| Blok | Ja | Het blok waar de waarden vanuit gekopieerd worden en die is gecodeerd in Blokken.
| Werkblad | Ja | Het werkblad waar de referentie naar verwijst. |
| Kolom 1 | Ja | De kolom waar de expressie naar verwijst. |
| Rij 1 | Ja | De rij waar de expressie naar verwijst. |
| Kolom 2 | Nee | Met de tweede kolom kan het bereik w orden aangegeven van de kolom. |
| Rij 2 | Nee | Met de tweede rij kan het bereik w orden aangegeven van de rij. |

Waarbij de volgende mogelijkheden aanwezig zijn:

<table>
<thead>
<tr>
<th>Onderdeel</th>
<th>Opties</th>
<th>Extra optie</th>
<th>Uitleg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draaimethode</td>
<td>D, E</td>
<td>Eerste cel en eerste rij</td>
<td>Zoals bij het blok opgegeven</td>
</tr>
<tr>
<td>Blok</td>
<td><em>Bloknaam</em></td>
<td>Het huidige blok</td>
<td>Naam van het blok</td>
</tr>
<tr>
<td>Werkblad</td>
<td><em>Werkbladnaam</em></td>
<td>Huidige w erkblad</td>
<td>Naam van het werkblad</td>
</tr>
</tbody>
</table>
### Voorbeeld van gebruik celreferentie expressie:

<table>
<thead>
<tr>
<th>Onderdeel</th>
<th>Voorbeeld</th>
<th>Uitleg voorbeeld</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Draaimethode</strong></td>
<td>D</td>
<td>De eerste cel en de eerste rij</td>
</tr>
<tr>
<td></td>
<td>E</td>
<td>Zoals bij het huidige blok is opgegeven</td>
</tr>
<tr>
<td><strong>Blok</strong></td>
<td>.</td>
<td>Het huidige blok</td>
</tr>
<tr>
<td></td>
<td>&quot;Projecten&quot;</td>
<td>Het blok projecten</td>
</tr>
<tr>
<td><strong>Werkblad</strong></td>
<td>.</td>
<td>Het huidige werkblad</td>
</tr>
<tr>
<td></td>
<td>&quot;Werkblad 1&quot;</td>
<td>Het werkblad &quot;Werkblad 1&quot;</td>
</tr>
<tr>
<td></td>
<td>^+1</td>
<td>Het tweede werkblad</td>
</tr>
<tr>
<td></td>
<td>$-1</td>
<td>Het op één na laatste werkblad</td>
</tr>
<tr>
<td><strong>Kolom 1</strong></td>
<td>-.1</td>
<td>De huidige kolom min één</td>
</tr>
<tr>
<td></td>
<td>$&quot;Projectcode&quot;</td>
<td>De kolom &quot;Projectcode&quot;</td>
</tr>
<tr>
<td></td>
<td>^+2</td>
<td>De derde kolom van het blok</td>
</tr>
<tr>
<td></td>
<td>$</td>
<td>De laatste kolom van het blok</td>
</tr>
<tr>
<td><strong>Rij 1</strong></td>
<td>.+1</td>
<td>De huidige rij plus één</td>
</tr>
<tr>
<td></td>
<td>&quot;$Projectcode&quot;</td>
<td>De rij &quot;Projectcode&quot;</td>
</tr>
<tr>
<td></td>
<td>^-1</td>
<td>De rij boven het blok</td>
</tr>
<tr>
<td></td>
<td>$</td>
<td>De laatste rij van het blok</td>
</tr>
<tr>
<td><strong>Kolom 2</strong></td>
<td>.</td>
<td>De huidige kolom</td>
</tr>
<tr>
<td></td>
<td>&quot;$Projectcode&quot;</td>
<td>Tw ee verder dan de kolom &quot;Projectcode&quot;</td>
</tr>
<tr>
<td></td>
<td>^+3</td>
<td>De vierde kolom</td>
</tr>
<tr>
<td></td>
<td>$-2</td>
<td>De tw ee na laatste kolom</td>
</tr>
<tr>
<td><strong>Rij 2</strong></td>
<td>.+2</td>
<td>De huidige rij plus twee</td>
</tr>
<tr>
<td></td>
<td>&quot;$Projectcode&quot;</td>
<td>De rij &quot;Projectcode&quot;</td>
</tr>
<tr>
<td></td>
<td>^-1</td>
<td>De rij boven het blok</td>
</tr>
<tr>
<td></td>
<td>$</td>
<td>De laatste rij van het blok</td>
</tr>
</tbody>
</table>

Een veelgebruikte celreferentie expressie is $C{E,.,.,^ ,.}: de eerste kolom van de huidige rij.

Bij de onderdelen Werkblad, Kolom 1/2 en Rij 1/2 is het mogelijk om ook bij de extra opties - of + met een natuurlijk getal op te geven. De extra optie zorgt ervoor dat er er bij de optie en getal afgetrokken of opgeteld wordt.

Eigenschappen celreferentie expressie:
- hoofdlettergevoelig;
- werkt ook binnen SQL-functies, zoals SUM, COUNT, AVG, enz.
In Invantive Control

Een celreferentie expressie wordt gedefinieerd in de select van een Blok in de Modelbewerker. In de onderstaande afbeelding staan een aantal voorbeelden van het gebruik van celreferentie expressie in de select.

$C{Beginpunt, Blok, Werkblad, Kolom, Rij, Kolom1, Kolom2}

Met doel celverwijzing

Plaatje excel control

Formula, Expression aan bij 't veld. en sync back uit.

Een voorbeeld van celreferentie expressie is in een kolom is: "$C{"Block 1","tcn_name",}" expression1. Dit voorbeeld ...

[] -> []

<table>
<thead>
<tr>
<th>Deze formule:</th>
<th>Verwijst naar:</th>
<th>En geeft als resultaat:</th>
</tr>
</thead>
<tbody>
<tr>
<td>=C2</td>
<td>Cel C2</td>
<td>De waarde in cel C2</td>
</tr>
<tr>
<td>=Activa-Passiva</td>
<td>De cellen met de naam Activa en Passiva</td>
<td>De waarde in de cel Passiva afgetrokken van de waarde in de cel Activa</td>
</tr>
</tbody>
</table>

1.4.4.3 Repository Werkbladen

De repository werkbladen bevat een leeg werkblad en een werkblad met de XML-code waarin het model beschreven staat. Dit tabblad is alleen zichtbaar als je op de knop 'Repository Werkbladen' klikt, zie Gebruikersinterface Modelontwikkelaar.

1.4.4.4 Toon Spoor

De functie 'Toon Spoor' kun je gebruiken om eventuele fouten in de werken van Invantive Control for Excel te analyseren. Het venster wordt alleen getoond als de knop 'Toon Spoor' aangezet is, zie Gebruikersinterface Modelontwikkelaar.

Invantive Support kan vragen om 'Toon Spoor' aan te zetten en de teksten op te sturen om je te helpen bij het analyseren van problemen.
1.5 Voorbeelden

1.5.1 Rekenmodel

Ontwikkelen van een model

ERD diagram bijvoegen
1.5.2 Offline Werken
1.5.3 Beheer van Gegevens

Een ander voorbeeld om Invantive Control for Excel te gebruiken is voor het beheer van gegevens.

CRM-gegevens

- Organisaties
- Personen

Invoeren en bijwerken van grote blokken gegevens.
On Invantive-internal development workstations only, a non-standard Customer Service node can be selected by specifying a deviating URL in the environment variable `INVANTIVE_CS_BASE_URL`.

### 2.1.2 OS Platform

A variety of Invantive products is available on Windows, Linux and Mac OSX. The list of supported platforms varies per product, depending on the availability of the libraries such as Microsoft .NET Core.

The OS platform is automatically determined by Invantive software, but sometimes can raise bugs given the bleeding edge nature of Microsoft .NET Core. It is possible to overrule the automatic detection of the OS platform by assigning a value to the environment variable `INVANTIVE_FORCED_OS`. The following values are supported:

- **windows**: Microsoft Windows,
- **linux**: Linux,
- **osx**: Mac OSX.

### 2.1.3 Startup Checks

The Invantive products execute a number of checks at application start to ensure that the environment running the software meets a number of pre-conditions as established by Invantive. These checks can be disabled for analysis purposes and out-of-the-ordinary deployment scenarios.

Support on products is only available when checks are not manually configured.

The following environment variables allow manual configuration of the checks by setting them to ‘true’ or ‘false’:

- **INVANTIVE_CHECK_SYSTEM_COMPATIBILITY**: validate system compatibility.
- **INVANTIVE_MAINTAIN_VSTO**: re-activate Invantive VSTO add-ins when disabled.
- **INVANTIVE_CHECK_OS_UPDATES**: validate OS updates have been applied sufficiently recent.

Configuration of checks is solely available on the Windows OS platform.

### 2.1.4 Cryptography

The Invantive products use cryptographic operations to protect:

- License key
- Invantive Keychain

By default, a key pair is used and stored in the profile of the user for encryption and decryption.

### Windows

On Windows, the encryption is normally done using Windows-managed encryption protocols. The key elements are stored in the roaming profile of the current user.

In some deployment scenarios, a user has only a temporary Windows profile. In that case it is not possible to store a key pair. This is typically signaled by an itgenlic510 error code.
As an alternative, you can configure the environment variable `INVANTIVE_CRYPTOGRAPHY` to the value "MACHINE" to use a key pair that is stored solely on the device.

By setting the environment variable `INVANTIVE_RSA` to `INVANTIVE`, encryption on Windows is also managed as on other platforms by custom Invantive code at the expense of loss of some security features. Often Windows patches break the functionality of previously Windows-managed encryption keys, typically signaled by a error like "Key not valid for use in specified state". Switching to custom Invantive code will solve this problem.

**Linux, Mac OSX, Android, iPhone, Windows on Parallels**

On all other platforms, Invantive offers solely encryption using key elements stored in files in the RSA folder.

### 2.1.5 UI Language

The Invantive products supported approximately ten languages. On first startup, the language of the Windows version will be used when supported. Otherwise US-English is used.

The license decides which from the languages are supported.

Additionally, the user interface language chosen can further be restricted by setting the environment variable `INVANTIVE_ALLOWED_LANGUAGE_CODES` to a comma-separated list of two characters ISO 639-1 codes.

### 2.1.6 Folders

The Invantive products store configuration and runtime information in a folder hierarchy. This hierarchy is located within the Invantive folder of the user profile. It can be opened in Windows Explorer by entering `%USERPROFILE%\Invantive` in the location bar.

The location of the folder hierarchy can be changed using environment variables. The central location can be changed by setting the environment variable `INVANTIVE_CONFIGURATION_FOLDER` to a different folder.

A number of subfolders can be relocated too:

- `INVANTIVE_CONFIGURATION_BACKUP_FOLDER`: the folder with backups of settings files. Defaults to the master folder plus "Backup".
- `INVANTIVE_CONFIGURATION_CACHE_FOLDER`: the folder with disk cache files. Defaults to the master folder plus "Cache".
- `INVANTIVE_CONFIGURATION_HTTP_CACHE_FOLDER`: the folder with HTTP disk cache files. Defaults to the root cache folder plus "http" and the OS-user and front-end user.
- `INVANTIVE_CONFIGURATION_DATA_CACHE_CACHE_FOLDER`: the folder with Data Cache disk cache files. Defaults to the root cache folder plus "datacache". Disk cache files improve performance of HTTP downloads, but when necessary can be purged.
- `INVANTIVE_CONFIGURATION_LOG_FOLDER`: the folder with log files. Defaults to the master folder plus "Log".
- `INVANTIVE_CONFIGURATION_DATABASES_FOLDER`: the folder with databases files. Defaults to the master folder.
- `INVANTIVE_CONFIGURATION_PLUGINS_FOLDER`: the folder with plugin files. Defaults to the master folder plus "Plugins".
• **INVANTIVE_CONFIGURATION_PROVIDERS_FOLDER**: the folder with provider files. Defaults to the master folder plus "Providers".

• **INVANTIVE_CONFIGURATION_RSA_FOLDER**: the folder with RSA configuration files. Defaults to the master folder plus "RSA".

• **INVANTIVE_CONFIGURATIONTEMPLATES_FOLDER**: the folder with template files. Defaults to the master folder plus "Templates".

• **INVANTIVE_CONFIGURATION_TRACE_FOLDER**: the folder with trace files. Defaults to the master folder plus "Trace".

The values may contain any combination of the following placeholders which will be expanded:

• **iid**: Invantive Installation ID.

• **sessionid**: Invantiv session ID.

• **frontenduser**: name of front-end user (when available).

• **osuser**: name of operating system user.

A folder can be configured for custom translations which overrule all default translations using the environment variable **INVANTIVE_I18N_FOLDER**.

### 3 Invantive SQL

One of the most familiar questions at our support desk is "what functions are available" in Invantive SQL to query data in Exact Online.

This second-generation SQL parser is an extensive implementation of many commonly found SQL constructs from the ANSI SQL standard.

It includes in addition to the features of the first-generation SQL parser also:

• joins,

• outer joins,

• cross joins,

• group functions such as stddev, avg and listagg,

• value functions such as xmlescape and round.

There are two flavors shipped:

• Free version: second-generation SQL parser without joins and some upcoming non-ANSI standard advanced mapping functions for large volume financial analysis and reporting.

• Paid version: identical to the free version but with joins and advanced mapping functions.

The EBNF-grammar in [Grammar](#) depicts the possibilities.

### 3.1 Language

#### 3.1.1 Compatibility

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft
SQL Server. It is topped of with Invantive-specific extensions, especially for procedural SQL, distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few. The same holds for the procedural extension Invantive Procedural SQL, which reflects SQL/PSM and makes it easy to port Oracle PL/SQL or PostgreSQL PL/pgSQL statements.

3.1.2 Distributed SQL, Databases and Data Containers

It is easy to exchange and/or combine data across the supported platforms with data. To each platform (such as Salesforce or Exact Online Belgium) multiple connections can be active with the same or different platform-specific connection settings. Each open connection to a platform is named a 'data container'.

All opened connections together are named a 'database'.

When multiple data containers have been opened, each one has an alias to refer it by in Invantive SQL statements. For instance, a connection can be open for two different customer accounts on Exact Online Netherlands aliased as 'eolnl_comp1' and 'eolnl_comp55') and one for an Exact Online Belgium custom, aliased as 'eolbe_my_new_company'. The aliases can be freely chosen as long as they are valid identifiers and defined in the databases configuration file 'settings.xml'.

3.1.3 Service Providers

A number of special connections are always made, each of which can occur at most once. These are the 'service providers' such as:

- 'datadictionary': metadata of the current database, such as list of tables and executed SQL statements performance.
- 'os': information on the operating system running the SQL engine, such as reading file contents.
- 'smtp': synchronously send mails through SMTP.

3.1.4 Partitioning

Especially online platforms have a multi-tenant structure, in which the data is partitioned per customer, company or person. When the data model is identical across tenants, Invantive SQL considers them 'partitions'. SQL statements can run across multiple or one partitions, often in parallel. This enables consolidation scenarios across partitions (such as Exact Online or Nmbrs companies) as well as high-performance in MPP environments.

The partitions to be used can be specified with the 'use' statement, either through an explicit list of partitions to be selected across data containers, or through a SQL select statement returning the list of partitions to use. Please note that although the 'use' statement resembles the 'use DATABASE' statement on Microsoft SQL Server or PostgreSQL you can on Invantive SQL have multiple partitions active at the same time in one user session.

3.1.5 Identifiers

For identifiers, the regular conventions hold for the set of allowed characters. Depending on the platform, the identifiers are case sensitive or not. In general, it is best to assume that the identifier are case insensitive. There is no length limit on an identifier imposed by Invantive SQL.
3.1.6 Procedural SQL

Invantive Procedural SQL (or "PSQL" for short) is a procedural extension on top of Invantive SQL. It is based on the ISO-standard 9075-4:2016 (SQL/PSM) and extends Invantive SQL with procedural options like blocks, variables, conditional execution and loops. The procedural code is - together with the Invantive SQL contained - as a whole into pseudo-code and then executed.

The procedural code does not lean on the procedural options of the platforms being used, so it is easy to retrieve and change data in all supported cloud, file and database platforms. The pre-compiled procedural code does not perform context switches between procedural and SQL logic.

3.1.7 Licensing

The available functionality of Invantive SQL features is based upon the license features. For instance the free implementation of Invantive SQL is limited to 1.000 rows and no access to group functions. Please consult the data dictionary contents for your license features.

3.1.8 Settings.xml

The file settings.xml defines for a user or program the list of defined databases. Databases are grouped in 'database groups' for visual display. Database groups have no further functionality. Each database consists of one or multiple data containers.

The file 'settings.xml' is most often found on Microsoft Windows in your '%USERPROFILE%\invantive' folder, such as 'c:\users\john.doe\invantive\settings.xml'. It is shared across all Invantive SQL product installations for the user.

There are many scenarios to share database specifications across a user community, such as WAN-scenarios with Invantive Web Service, large corporate scenarios using DNS-entries as well as file shares, included files as well as single user solutions. Please involve a consultant when you want to deploy across thousands of users or more.

For user communities of up to 10 users, we recommend that company-specific settings are grouped per role in a separate file named 'settings-ROLE.xml' and placed in the default folder. Invantive SQL will automatically merge these files in the main settings.xml file.

3.1.9 Group Functions

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped of with Invantive-specific extensions, especially for distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few.

Popular group functions such as 'stddev' are available. However, currently you can not combine in one unnested SQL statement both group functions as well as expressions on the variables. In that case use an inner (nested) SQL statement to apply the expressions on the data, and execute the group functions in the outer SQL statement with the syntax 'select group() from ( select ... from ... )'.

3.1.10 Locking

An Invantive SQL statement can work with many traditional and online platforms. There are no locking features on data and objects, since few online and traditional platforms connected provide these and the typical use of distributed transactions leave even less opportunity for data and object locking.
3.1.11 Transactions

Invantive SQL has limited support for transactions. DML is forwarded to a platform and depending on the platform an error can cause part of the work to be registered or everything to be rolled back. Within the SQL engine, multiple changes can be collected and forwarded to the platform at once. For instance, when creating an EDIFACT message you need to combine an invoice header with invoice lines into one EDIFACT message. Collection of multiple changes is done using the ‘identified by’ and ‘attach to’ syntax, optionally preceded by ‘begin transaction’.

3.1.12 Grammar

sqlBatch:

sqlOrPSqlStatement BATCHSEPARATOR BATCHSEPARATOR sqlBatch

::= sqlOrPSqlStatement BATCHSEPARATOR sqlBatch

no references

sqlOrPSqlStatement:

sqlStatement pSqlStatement

::= sqlStatement | pSqlStatement

referenced by:

- sqlBatch

sqlStatement:

An Invantive SQL can retrieve data from many traditional and online platforms. Many platforms also support the use of DML (Data Manipulation Language) statements to change the data contained. On a few platforms you can execute DDL (Data Definition Language) statements to create new data structure or objects such as tables, procedures or sequences.

selectStatement insertStatement updateStatement deleteStatement ddlStatement setState-

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
selectStatement:
A SQL select statement retrieves data from one or multiple data containers. A select statement can be composed of multiple data sets retrieved from many platforms, combined by set operators such as 'union'.

Often the performance of cloud platforms is less than traditional database platforms. With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'. An alternative for a 'limit' clause is to use the 'top' clause.

A sequence of Inventive SQL statements, separated by the semi-colon separator character.

Each statement in the SQL batch will be executed consecutively. Execution will be stopped when an error occurs during execution of a statement.

uniqueSelectStatement setOperatorSelectStatement orderBy limitClause

inSelectStatement:
A SQL select statement retrieves data from one or multiple data containers. This variant makes this data available to a containing SQL select statement. This feature is also known as an 'inline view'.

selectStatement
::= selectStatement

referenced by:
- predicateExpression

setOperatorSelectStatement:
SQL is based upon a solid mathematical foundation named 'set theory' with some exceptions. The set operators of Inventive SQL enable you to combine sets of data sets such as merging two sets of data. Please note that SQL actually uses 'bags', which opposed to 'sets', allow duplicates. To change bags of data into sets, either use 'distinct' or the 'union' set operator without 'all'. In general, the extensive use of 'distinct' signals bad database design.
The 'union' set operator returns the union of the data on the left and right side of the union while removing duplicate rows. The 'union all' set operator returns the union of the data on the left and right side of the union without removing duplicate rows. The 'minus' set operator returns all rows from the left side which do not occur in the right side. The 'intersect' set operator returns all rows that occur both in the left and right side.

```
UNION ALL MINUS_C INTERSECT uniqueSelectStatement
```

uniqueSelectStatement:

Retrieves a data set from one or more data containers.

```
select executionHints distinct topClause selectList INTO variableList FROM dataSource joinStatements whereClause groupBy
```

```
uniqueSelectStatement ::= select [executionHints]? distinct topClause? selectList [INTO variableList]? FROM dataSource [joinStatements]? whereClause? groupBy?
```

dataSource:

A data source can be a table, a table with parameters or a nested select (an 'inline view').

```
dataSource ::= ( tableOrFunctionSpec | embeddedSelect | xmlTableSpec | csvTableSpec | jsonTableSpec ) [aliased]
```

```
dataSource ::= ( tableOrFunctionSpec | embeddedSelect | xmlTableSpec | csvTableSpec | jsonTable Spec ) [aliased]
```

select:

```
SELECT
```

```
select ::= SELECT
```

executionHints:
Execution hints allow you to control individually the execution of SQL statements. Whenever possible, the hints will be used. In contrary to other platforms, Invantive SQL requires a hint to be valid according to the grammar when specified. This reduces the engineering risk that hints become invalid by accident.

EXECUTION_HINT_START joinSet noJoinSet ods resultSetName lowCost httpDiskCache httpMemoryCache EXECUTION_HINT_END

Referenced by:
* uniqueSelectStatement

httpDiskCache:

The http_disk_cache-hint specifies whether messages may be cached on disk when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the disk cache, the second parameter is a boolean whether data retrieved must be stored also in the disk cache and the third parameter is an integer that specifies the number of seconds before a disk cache hit found is to considered stale.

The use of the http_disk-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents of the disk cache are persistent across Invantive SQL sessions.

The disk cache is located in the Cache folder of the Invantive configuration folder.

HTTP_DISK_CACHE PARENTESIS_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTESIS_CLOSE

Referenced by:
* executionHints

httpMemoryCache:

The http_memory_cache-hint specifies whether messages may be cached in memory when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the memory cache, the second parameter is a boolean whether data retrieved must be stored also in the memory cache and the third parameter is an integer that specifies the number of seconds before a memory cache hit found is to considered stale.

The use of the http_memory-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents in the memory cache are forgotten across Invantive SQL sessions.
The memory cache is located in the Cache folder of the Invantive configuration folder.

HTTP_MEMORY_CACHE PARENTHESIS_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESIS_CLOSE

httpMemoryCache ::= HTTP_MEMORY_CACHE PARENTHESIS_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESIS_CLOSE

ods:

The ods-hint controls the use of the Invantive Data Cache stored in a relational database.

The Invantive Data Cache is also the basis of the Operational Data Store managed by Invantive Data Replicator and the data warehouses managed by Invantive Data Vault. The ods-hint specifies the maximum age data from the data cache eligible for use.

The boolean specifies whether the Data Cache may be used to answer a query. Set it to false to disable use of Data Cache for the duration of the query. Keep it on the default true to use Data Cache.

The interval specifies the period of time during which cached results are considered sufficiently fresh for use, such as '30 minutes'.

When no interval is present, the actual platform is consulted. The default with Invantive Data Cache enabled is to always use the data cache contents when not stale according to the metadata of the data cache. In general, that defaults to a maximum age of 7 days.

ODS PARENTHESIS_OPEN booleanConstant COMMA intervalConstant PARENTHESIS_CLOSE

ods ::= ODS PARENTHESIS_OPEN booleanConstant COMMA intervalConstant PARENTHESIS_CLOSE

resultSetName:

RESULT_SET_NAME PARENTHESIS_OPEN stringConstant PARENTHESIS_CLOSE

resultSetName ::= RESULT_SET_NAME stringConstant

joinSet:

Control join approach between two data sources. A column-indexed lookup will be used instead of a full table scan when the number of rows on the left-hand side does not exceed the maximum number of rows specified in the hint. When not specified, a hash lookup will only be used when the number of rows on the left-side does not exceed 5,000.
The actual implementation of a hash lookup depends on the platform on which the data container runs. For instance with OData, a number of requests will be made using an in-construct with a limited number of in-values. With a relation database platform, a native SQL 'in' will be used.

The first identifier is the alias of the table on the right-hand side of the join. The second identifier is the name of the column used to join upon in the right-hand side. The numeric constant specifies upto what number of rows on the left-hand side of the join will allow the join set hint to be used. When the number of rows exceeds the numeric constant, a full table join is made.

The following example takes for instances 5.000 sales invoices from an Exact Online environment with 100.000 sales invoices. Each sales invoice has 4..10 lines. The join does not retrieve all sales invoices nor all invoice lines, but instead fetches the 5.000 sales invoices using the where-clause, and then retrieves the related invoice lines using a column-indexed lookup by invoiceid. Since Exact Online is an OData source, the approximately 30.000 invoice lines will be retrieves in 300 session I/Os each having an in-construct for 100 lines on invoiceid.

```sql
select /*+ join_set(sil, invoiceid, 10000) */ * from ExactOnlineREST..SalesInvoices sik join ExactOnlineREST..SalesInvoiceLines sil on sil.invoiceid = sik.invoiceid where sik.status = 50 and sik.InvoiceDate between to_date( :P_RECEIPT_DATE_FROM , 'yyyymmdd') and to_date( :P_RECEIPT_DATE_TO, 'yyyymmdd')
```

```sql
JOIN_SET PARENTHESIS_OPEN identifier COMMA identifier COMMA numericConstant PARENTHESIS_CLOSE
```

```sql
noJoinSet:
The no_join_set hint disables the use of hash-joins. It can be enabled using the join_set hint.

```sql
NO_Join_SET PARENTHESIS_OPEN identifier COMMA identifier PARENTHESIS_CLOSE
```

```sql
variableList:
variableName COMMA variableName
```

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
lowCost:

The low_cost-hint specifies that the select with the hint must be considered a select with low execution costs. Low execution costs trigger early evaluation during parsing. By default, select statements using solely in memory storage, dummy and data dictionary are considered low cost and evaluated early. The evaluation of all others is delayed as long as possible.

The use of the low_cost-hint is recommended when the select is used with a 'in ( select ... )' syntax and the developer knows beforehand that it will evaluate fast to values and that the use of these values will allow the use of server-side filtering for the outer select.

LOW_COST

    lowCost ::= LOW_COST

referenced by:

    • executionHints

distinct:

Addition of the 'distinct' keyword to a SQL select statement de-duplicates the rows returned. Rows are considered duplicates when the values in all selected columns are identical, with two null-values considered equal.

DISTINCT

    distinct ::= DISTINCT

referenced by:

    • aggregateFunction
    • uniqueSelectStatement

topClause:

With the 'top' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'.

TOP numericConstant

    topClause ::= TOP numericConstant

referenced by:

    • uniqueSelectStatement

  • dataSource

tableSpec:
A table specification without parameters. The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

A number of special so-called 'service providers' are always present, such as 'datadictionary' for use by an alias.

fullTableIdentifier distributedAliasDirective
tableSpec ::= fullTableIdentifier distributedAliasDirective

referred by:
  • alterPersistentCacheDropStatement
  • alterPersistentCacheSetTableOptions
  • alterPersistentCacheTableRefreshStatement
  • createTableStatement
  • deleteStatement
  • dropTableStatement
  • insertStatement
  • updateStatement

tableOrFunctionSpec:
A table specification requiring a comma-separated list of parameters to determine the rows to be retrieved.

Traditional SQL syntax did not provide for parameterized queries, matching set theory. Modern variants such as pipelined table functions allow a stored procedure or other imperative language-based approaches to generate rows based upon parameter values. Many data containers support queries that returns rows based upon parameter values. This holds especially for SOAP web services. Table specifications with parameters ease queries on such data containers.
The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

- orderBy

columnList:
A comma-separated list of columns.

\[
\text{columnList} ::= \text{column} (\text{COMMA} \text{column})^*
\]

referenced by:
- groupBy
- insertFieldList

column:
A column is identified by an identifier, possibly prefixed by the name of the table or the alias of the table from which the column is to be taken.

\[
\text{column} ::= \text{identifier} (\text{DOT} \text{identifier})^?\]

referenced by:
- columnList
- orderBy
- updateValue

whereClause:
The where-clause restricts the number of rows in a result set by applying one or more boolean conditions which rows must satisfy.

\[
\text{whereClause} ::= \text{WHERE} \text{booleanExpression}
\]

referenced by:
- deleteStatement
- uniqueSelectStatement
- updateStatement

joinStatements:
A list of join statement.

```
joinStatement
  ::= joinStatement +
```

referenced by:
- `uniqueSelectStatement`

### joinStatement:

A join statement combines two result sets. Only combinations of rows taken from both result sets are returned when they meet the join conditions.

```
joinStatement join dataSource joinConditions
  ::= joinCategory join dataSource joinConditions
```

referenced by:
- `joinStatements`

### joinCategory:

The join category specifies what combinations of rows are considered. The following variants can be used:
- inner join, as indicated by 'join' or 'inner join': an inner join returns all combinations of rows from both result sets that meet the join conditions.
- left outer, as indicated by 'left outer join': a left outer join returns the same rows as an inner join, extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- right outer, as indicated by 'right outer join': a right outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. Each column that originates from the left result set is assigned a null value.
- full outer, as indicated by 'full outer join': a full outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. The results are also extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- cross join, as indicated by 'cross join': a cross join returns a Cartesian product of the rows from both result sets. A 'Cartesian product' is a term from set theory, which indicates that all combinations are returned.

```
inner joinSubCategory outer cross
  ::= ( inner | joinSubCategory outer? | cross )?
```

referenced by:

ddlStatement:
Invantive SQL

createTableStatement | dropTableStatement | alterPersistentCacheStatement

::= createTableStatement | dropTableStatement | alterPersistentCacheStatement

referenced by:
- sqlStatement

alterPersistentCacheStatement:

Besides an in-memory cache valid during the duration of a session, Invantive SQL offers an integrated cache storing data persistently using an on-premise or cloud relation database such as SQL Server or PostgreSQL. When configured, Invantive SQL first tries to find sufficiently fresh data in the cache. This reduces the number of data loads from slow data containers such as some cloud platforms. In general, the performance increase when the rows can be fully retrieved from a cache is between a factor 25 and 2,500.

Invantive SQL itself manages the table structure and table contents in the relation database used as a data cache. On initial use just provide an empty database. Invantive SQL installs a repository consisting of a few tables. The repository tables have names starting with 'dc_'.

For each table partition version, a so-called facts table is created. A facts table contains a full copy of the rows retrieved from the data container. Facts tables have names starting with 'dcd_', followed by a unique hash signaling the table partition version. When necessary, additional database objects are maintained such as indexes to improve performance. As with facts table names, all column names are also hashed based upon an algorithm including the original column name. These facts tables are not intended for direct use using native SQL.

Each facts table has a unique state from the following state, with Ready state signaling the now current version:
- Initializing ('I'): the facts table will be created.
- View creation ('V'): logical views will be created.
- Prepared ('P'): the facts table has been created, but contains yet no rows.
- Seeding ('S'): the facts table is being seeded with the contents of the previously current version.
- Loading ('L'): loading new facts from data container using water shed or another algorithm.
- Ready ('R'): the facts table is available and the current one to be used.
- Obsoleted ('O'): the facts table still exists, but the data has passed it's conservation period. Often a newer version is now current.
- Dropped ('D'): the facts table now longer exist, but the metadata is still present in the repository tables.

The persistent cache in the database can be used with native SQL when extended by Invantive Data Replicator. Invantive Data Replicator can create and maintain a database view (a so-called 'partition view') for the now current version of table partition. Similarly, it can create an 'overall view', showing the rows across all partitions of the now current versions per partition.

The overall views are typically used for consolidation purposes, bringing together data across multiple companies or persons.

• `sqlStatement[42]`
beginTransactionStatement:

A begin transaction statement initiates a transaction. Invantive SQL typically provides no transaction logic given the distributed nature and the limitations of the possible platforms. Some platforms enable collection of transaction data, which are to be handed over to the backing platform all together.

BEGIN TRANSACTION

beginTransactionStatement::= BEGIN TRANSACTION

referenced by:
- transactionStatement

rollbackTransactionStatement:

Forgets all collected transaction data not yet handed over to the backing platform.

ROLLBACK TRANSACTION

rollbackTransactionStatement::= ROLLBACK TRANSACTION

referenced by:
- transactionStatement

commitTransactionStatement:

Hand over all collected transaction to the backing platform for registration.

COMMIT TRANSACTION

commitTransactionStatement::= COMMIT TRANSACTION

referenced by:
- transactionStatement

useStatement:

The use statement enables you to specify which partitions should be accessed by subsequent select, insert, update and delete statements. You can specify one or multiple partitions as a comma-separated list, possibly for a specific data container by appending an at-sign plus data container alias to the partition code. The value 'default' has a special meaning; it specifies to use the partition(s) originally selected when you logged on. The value 'all' also has a special meaning: it selects all partitions available.

For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use 35@eolnl, 57345@nmbrsnl'.

For complex scenarios, you can specify any valid Invantive SQL select statement which returns one or two columns. Each row from the query specifies one partition to select. The first column specifies the partition code, whereas the optional second column specifies a specific data container alias.
For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use select '35', 'eolnl' from dual@datadictionary union all select '57345', 'nmbrsnl' from dual@datadictionary'.

(referenced by:
• arithmeticExpression[82])
abs:
Returns the absolute value of a double-precision floating-point number.

Parameters:
- Input: A number that is greater than or equal to System.Double.MinValue, but less than or equal to System.Double.MaxValue.

Returns: A double-precision floating-point number. ABS

```
abs [83]: ::= ABS [83]
```

 acos:
Returns the angle of the provided cosine.

Parameters:
- Input: the cosine to get the angle of.

Returns: A number which represents the angle of the provided cosine. ACOS

```
acos [84]: ::= ACOS [84]
```

 anonymize:
Anonymize a text or number. Anonymization is executed such that when the same original value is anonymized within the same session, the anonymized value will be identical. The anonymized value also uniquely matches the original value. With no access to the anonymization map however, the original value can however not be calculated from the anonymized value.

In mathematics, the anonymization function is a bijection: each element of the original set is paired with exactly one element of the anonymized set, and each element of the anonymized set is paired with exactly one element of the original set.

Parameters:
- Value: A text or number to be obfuscated.
- Maximum length (optional): Maximum length in digits for numbers or characters for text of anonymized value. Null means no restriction on maximum length.
- Mapping (optional): algorithm to use. The default algorithm is 'DEFAULT' which maps text values to a range of hexadecimal characters and numbers to a range of numbers. Alternative mappings are described below.

The following anonymization maps are available on installation:
- DEFAULT: the default algorithm.
- IVE-GL-JOURNAL-DESCRIPTION: general ledger journal descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
IVE-GL-ACCOUNT-DESCRIPTION: general ledger account descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
IVE-PSN-FIRST-NAME: person first names: prefer readable alternative first names, anonymize all.
IVE-PSN-LAST-NAME: person last names: prefer readable alternative last names, anonymize all.
IVE-ADS-CITY-NAME: address city names: prefer readable alternative city names, anonymize all.
IVE-ADS-STREET-NAME: address street names: prefer readable alternative street names, anonymize all.

The data dictionary contains the anonymization maps used so far in the session and their corresponding values:

```sql
select * from SystemAnonymizationMaps@DataDictionary
select * from SystemAnonymizationMapValues@DataDictionary
select * from SystemAnonymizationPredefinedMaps@DataDictionary
```

Returns: Anonymized value. ANONYMIZE

```sql
anonymize ::= ANONYMIZE
```

Referenced by:
- functionExpression

ascii:
Get the position of a character on database character set.

Parameters:
- Input: character to get position from.

Returns: The position of the character on database character set. ASCII

```sql
ascii ::= ASCII
```

Referenced by:
- functionExpression

asin:
Returns the angle of the provided sine.

Parameters:
- Input: the sine to get the angle of.

Returns: A number which represents the angle of the provided sine. ASIN

```sql
asin ::= ASIN
```

Referenced by:
- functionExpression

atan:
Returns the angle of the provided tangent.
Parameters:

- Input: the tangent to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN

\[
\text{atan} \quad ::= \quad \text{ATAN}
\]

referred by:

- \text{functionExpression}[

\text{atan2}: 

Returns the angle of the provided tangent.

Parameters:

- First number: the first number to get the angle of.
- Second number: the second to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN2

\[
\text{atan2} \quad ::= \quad \text{ATAN2}
\]

referred by:

- \text{functionExpression}[

\text{add_months}: 

Add an amount of months to a datetime.

Parameters:

- Date: datetime to add the months to.
- Months: the amount of months to add.

Returns: A new datetime with the amount of months added. ADD_MONTHS

\[
\text{add_months} \quad ::= \quad \text{ADD_MONTHS}
\]

referred by:

- \text{functionExpression}[

\text{base64_decode}: 

Converts the base64_encoded value back to the binary value as defined on Wikipedia.

Parameters:

- Input: value to convert back to the original.

Returns: The input decoded back to the binary value. BASE64_DECODE

\[
\text{base64_decode} \quad ::= \quad \text{BASE64_DECODE}
\]

referred by:

- \text{functionExpression}[

\text{base64_encode}: 

Converts a binary value to base64-encoded characters as defined on Wikipedia.

Parameters:
- **Input**: value to convert to base64 characters.

Returns: The input encoded to base64 characters. BASE64_ENCODE

\[
\text{BASE64_ENCODE} = \text{BASE64_ENCODE}^{[87]}
\]

referenced by:
- **functionExpression**[^83]

---

**camel**:

Converts provided string to Camel case.

Parameters:
- **Input**: the string that will be converted to Camel case.

Returns: A string converted to Camel case. CAMEL

\[
\text{CAMEL} = \text{CAMEL}^{[87]}
\]

referenced by:
- **functionExpression**[^83]

---

**ceil**:

Rounds the input to the largest following integer. Unless an amount of decimals is defined, in which case it rounds to the largest integer number with the amount of decimals or date with the amount of positions.

Parameters:
- **Input**: A number or datetime to ceil.
- **Decimals** [optional]: A number to specify how many decimals it may ceil to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The ceiling of the input. CEIL

\[
\text{CEIL} = \text{CEIL}^{[87]}
\]

referenced by:
- **functionExpression**[^83]

---

**chr**:

Get a character from database character set.

Parameters:
- **Input**: a numeric value of a character.

Returns: A character from the database character set. CHR CHAR

\[
\text{CHR} = \text{CHR}^{[67]} \mid \text{CHAR}^{[42]}
\]

referenced by:
[^83]: Referenced by functionExpression.
bit_length:
Get the number of bits needed to represent a value. For a blob, this is the number of bits for the bytes of the blob. For all other data types, the value is first converted to a string and then the number of bits of the UTF8 representation is determined.
Parameters:
  - Value: value to determine length in bits for.
Returns: number of bits needed to represent the value. BIT_LENGTH
  bit_length ::= BIT_LENGTH
  referenced by:
    - functionExpression

octet_length:
Get the number of bytes needed to represent a value. For a blob, this is the number of bytes of the blob. For all other data types, the value is first converted to a string and then the number of bytes of the UTF8 representation is determined.
Parameters:
  - Value: value to determine length in bytes for.
Returns: number of bytes needed to represent the value. OCTET_LENGTH
  octet_length ::= OCTET_LENGTH
  referenced by:
    - functionExpression

repeat:
Get a concatenation of the text by a number of times.
Parameters:
  - Text: text to repeat.
  - Times: number of time to repeat the text.
Returns: the text repeated a number of times. REPEAT
  repeat ::= REPEAT
  referenced by:
    - functionExpression

raise_error:
RAISE>Error
  raise_error ::= RAISE_ERROR
  referenced by:
coalesce:
Performs a coalescing operation.
Parameters:
- Left: an object.
- Right: an object.
Returns: the left value if right is empty, otherwise the right value. COALESCE
\[
\text{coalesce} \ ::= \text{COALESCE}
\]

concat:
Concatenate the left and right values together as a text.

\[
\text{concat} \ ::= \text{CONCAT_OP}
\]

concat_func:
Concatenate a list of values together as a text.

\[
\text{concat_func} \ ::= \text{CONCAT}
\]

cos:
Returns the cosine of the provided angle.
Parameters:
- Input: the angle to get the cosine of.
Returns: A number which represents the cosine of the provided angle. COS
\[
\text{cos} \ ::= \text{COS}
\]

floor:

Rounds the input to the smallest following integer. Unless an amount of decimals is defined, in which case it rounds to the smallest integer with the amount of decimals or date with the amount of positions.

Parameters:
- Input: A number or datetime to floor.
- Decimals [optional]: A number to specify how many decimals it may floor to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The floor of the input. FLOOR

\[
\text{floor} ::= \text{FLOOR}
\]

Referenced by:
- functionExpression
from_unixtime:
Get the date/time from an integer representing a UNIX epoch time.
Parameters:
• Input: An integer.
Returns: The date/time which the UNIX epoch time represents. FROM_UNIXTIME

from_unixtime ::= FROM_UNIXTIME

referenced by:
• functionExpression

hour:
Collect the hour from a date.
Parameters:
• Input: A dateTime.
Returns: The hour as an integer. HOUR

hour ::= HOUR

referenced by:
• functionExpression

initcap:
Changes the first letter of each word in uppercase, all other letters in lowercase.
Parameters:
• Input: Text to convert.
Returns: The input with the first letter of each word in uppercase. INITCAP

initcap ::= INITCAP

referenced by:
• functionExpression

instr:
Get a number which is a position of the first occurrence of substring in the string.
Parameters:
• String: String to be searched.
• Substring: Text to search for.
• StartPosition [optional]: Position of string to start searching.
• occurrence [optional]: Return the position of the occurrence.
Returns: The position of the substring inside the original string. INSTR

instr ::= INSTR

referenced by:
• functionExpression
jsondecode:

\[
\text{JSONDECODE} = \text{JSONDECODE} \\
\]

referenced by:
- functionExpression

jsonencode:

\[
\text{JSONENCODE} = \text{JSONENCODE} \\
\]

referenced by:
- functionExpression

length:

Gets the number of characters in provided string.

Parameters:
- Input: the string to get the length of.

Returns: A number which represents the number of characters in the provided string.

\[
\text{LENGTH} = \text{LENGTH} \\
\]

referenced by:
- functionExpression

levenshtein:

Determine the Levenshtein distance between two values as defined on Wikipedia.

\[
\text{LEVENSHTEIN} = \text{LEVENSHTEIN} \\
\]

referenced by:
- functionExpression

list:

\[
\text{COMMA} = \text{COMMA} \\
\]

referenced by:
- arithmeticExpressionList
In:
Get the natural logarithm of a number.

Parameters:
- Input: a number to get the natural logarithm from.

Returns: The natural logarithm of the input. \( \text{LN} \)

\[ \text{ln} ::= \text{LN} \]

referenced by:
- functionExpression\[83\]

log:
Get the natural logarithm of a number in a specified base.

Parameters:
- Input: a number to get the natural logarithm from.
- Base [optional]: the base to get the natural logarithm from.

Returns: The natural logarithm of the input in the specified base. \( \text{LOG} \)

\[ \text{log} ::= \text{LOG} \]

referenced by:
- functionExpression\[83\]

lower:
Converts provided string to lowercase.

Parameters:
- Input: the string that will be converted to lowercase.

Returns: A string converted to lowercase. \( \text{LOWER} \)

\[ \text{lower} ::= \text{LOWER} \]

referenced by:
- functionExpression\[83\]

lpad:
Pad a string to the left to make it a specified length.

Parameters:
- Input: string to be padded.
- Length: the length the string should be padded to.
- Characters [optional]: Characters to pad with.

Returns: A string padded to the left to a given length with the optional specified characters. \( \text{LPAD} \)

\[ \text{lpad} ::= \text{LPAD} \]

referenced by:
- functionExpression\[83\]
ltrim:
Trims characters from the left side of a string.

Parameters:
- Input: the string from to trim characters from the left side.
- (Optional) Chars to trim: the character to trim. Default is " ".

Returns: A string with chars trimmed from the left. LTRIM

ltrim ::= LTRIM

referenced by:
- functionExpression

md5:
Converts a value to a 128-bit hash value as defined on Wikipedia.

Parameters:
- Input: Text to convert with MD5.

Returns: The input converted with MD5. MD5

md5 ::= MD5

referenced by:
- functionExpression

metaphone:
Converts a value to the Metaphone code as defined on Wikipedia.

Parameters:
- Input: value to convert to metaphone.
- Length: maximum output length of the given input.

Returns: The input converted to metaphone, with a given output length. METAPHONE

metaphone ::= METAPHONE

referenced by:
- functionExpression

metaphone3:
METAPHONE3

metaphone3 ::= METAPHONE3

referenced by:
- functionExpression
metaphone3_alt:

\[
\text{METAPHONE3\_ALT} = \text{METAPHONE3\_ALT}
\]

referenced by:

- \text{functionExpression}

mod:

Get the remainder of a divide calculation.

Parameters:
- dividend: a number.
- divider: a number.

Returns: The remainder. MOD

\[
\text{MOD} = \text{MOD}
\]

referenced by:

- \text{functionExpression}

minus:

Subtracts a value from another.

Parameters:
- Value: a number or datetime.
- Subtract: a number or datetime.

Returns: The value minus the subtraction. MINUS

\[
\text{MINUS} = \text{MINUS}
\]

referenced by:

- \text{arithmeticExpression}

minute:

Collect the minute from a date.

Parameters:
- Input: A dateTime.

Returns: The minute as an integer. MINUTE

\[
\text{MINUTE} = \text{MINUTE}
\]

referenced by:

- \text{functionExpression}

month:

Collect the month from a date.
Parameters:
  • Input: A date Time.

Returns: The month as an integer. MONTH

\[
\text{month} ::= \text{MONTH}
\]

referenced by:
  • \text{functionExpression}

\text{newid}:

Creates a new Guid id.

Returns: The new Guid id.

\[
\text{newid} ::= \text{NEWID}
\]

referenced by:
  • \text{functionExpression}

\text{nvl}:

Coalesce all values together.

Returns: All values coalesced together.

\[
\text{nvl} ::= \text{NVL}
\]

referenced by:
  • \text{functionExpression}

\text{plus}:

Adding a value to another.

Parameters:
  • Value: a number or datetime.
  • add: a number or datetime.

Returns: A new value with both values added to each other. PLUS

\[
\text{plus} ::= \text{PLUS}
\]

referenced by:
  • \text{arithmeticExpression}

\text{power}:

Gets a value of a number raised to another.

Parameters:
  • Value: a number.
  • exponent: a number.
Returns: The value of a number raised to another. POWER

\[ \text{power} ::= \text{POWER} \]

referenced by:

- functionExpression

random:
Generates a random number between 0 and 1.

Parameters:

- Seed: Produce a repeatable sequence of random numbers each time that seed value is provided.

Returns: A random number between 0 and 1. RANDOM

\[ \text{random} ::= \text{RANDOM} \]

referenced by:

- functionExpression

random_blob:
Generates a blob with pseudo-random values.

Parameters:

- Length: Produce a blob with this length in terms of bytes.

Returns: A blob with pseudo-random values. RANDOM_BLOB

\[ \text{random\_blob} ::= \text{RANDOM\_BLOB} \]

referenced by:

- functionExpression

rand:

RAND

\[ \text{rand} ::= \text{RAND} \]

referenced by:

- functionExpression

rank:

RANK

\[ \text{rank} ::= \text{RANK} \]

referenced by:

- functionExpression

regexp_substr:
Extracts a substring from the given value using regular expression.

Parameters:
- **Input**: The text to get the substring from.
- **Pattern**: Regular expression pattern.
- **Start position [optional]**: The start index from the input.
- **Appearance [optional]**: Indicating the appearance of the substr operation.
- **MatchParameter [optional]**: A text literal that lets you change the default matching behavior of the function.

Returns: The substring from the input. `REGEXP_SUBSTR`

```
regexp_substr ::= REGEXP_SUBSTR
```

*referenced by:*
- `functionExpression`

---

**regexp_instr**:

Determine the position of the regular expression in the given value. Returns 0 when the regular expression is not contained in the given value.

Parameters:
- **Input**: The text to get the regular expression position from.
- **Pattern**: Regular expression pattern.
- **Start position [optional]**: The start index from the input.
- **Appearance [optional]**: Indicating the appearance of the instr operation.
- **ReturnOption [optional]**: Select either the first character found or the first character after the occurrence of the pattern.
- **MatchParameter [optional]**: A text literal that lets you change the default matching behavior of the function.

Returns: The location of a regular expression pattern in the input. `REGEXP_INSTR`

```
regexp_instr ::= REGEXP_INSTR
```

*referenced by:*
- `functionExpression`

---

**regexp_replace**:

Replaces all occurrences matching the regular expression with the replacement value. The replacement value may contain references to matches in the regular expression by using the dollar-sign ('$') plus the reference number.

Parameters:
- **Input**: The text to get the substring from.
- **Pattern**: Regular expression pattern.
- **Replacement [optional]**: Text to replace with.
- **Start position [optional]**: The start index from the input.
- **Appearance [optional]**: Indicating the appearance of the replace operation.
• Match parameter [optional]: A text literal that lets you change the default matching behavior of the function. The available options are 'c' for case-sensitive, 'i' for ignore case, 'n' for single-line, 'm' for multi-line and 'x' for ignore pattern white space.

Returns: The input with every occurrence of the regular expression pattern replaced with the replacement.

```
REGEXP_REPLACE
  regexp_replace ::= REGEXP_REPLACE
```

referenced by:
- `functionExpression`

remainder:
Get the remainder of a divide calculation.

The REMAINDER function uses the round function in its formula, whereas the MOD function uses the floor function in its formula.

Parameters:
- Number1: a number.
- Number2: a number.

Returns: The remainder. REMAINDER

```
remainder ::= REMAINDER
```

referenced by:
- `functionExpression`

replace:
Replaces a string with string in given string.

Parameters:
- Input: the string to replace a string in.
- Old text: the string to be replaced.
- New text: the string which 'Old text' will be replaced with.

Returns: A string with the replaced string. REPLACE

```
replace ::= REPLACE
```

referenced by:
- `functionExpression`

reverse:
Flips the input around.

Parameters:
- Input: text to flip around.

Returns: The text with it's characters in reversed order. REVERSE
reverse::= REVERSE

referenced by:
  - functionExpression

round:

Rounds the input to the closest following integer. Unless an amount of decimals is defined, in which case it rounds to the closest integer number with the amount of decimals or date with the amount of positions.

Parameters:
  - Input: A number or datetime to round.
  - Decimals [optional]: A number to specify how many decimals it may round to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The rounded input. ROUND

round::= ROUND

referenced by:
  - functionExpression

row_number:

ROW_NUMBER

row_number::= ROW_NUMBER

referenced by:
  - functionExpression

rpad:

Rightpad function pads the right-side of a string with a specific set of characters to the given length. When no set of characters given, it will pad with a whitespace.

Parameters:
  - Input: Text to be padded.
  - Length: The length to make the input to.
  - Pad text [optional]: Text to add to the input if the length is larger then the input.

Returns: The padded text, or null if the string cannot be padded. RPAD

rpad::= RPAD

referenced by:
  - functionExpression

rtrim:

Trims characters from the right side of a string.

Parameters:
• Input: the string from which to trim characters from the right side.
• (Optional) Chars to trim: the character to trim. Default is ": ".

Returns: A string with chars trimmed from the right. RTRIM

\[
\text{rtrim}^{\text{103}} ::= \text{RTRIM}^{\text{103}}$
\]

referenced by:
• functionExpression^{83}

\textbf{microsecond:}

Collect the microsecond from a date.

Parameters:
• Input: A dateTime.

Returns: The microsecond as an integer. MICROSECOND

\[
\text{microsecond}^{\text{104}} ::= \text{MICROSECOND}^{\text{104}}$
\]

referenced by:
• functionExpression^{83}

\textbf{millisecond:}

Collect the millisecond from a date.

Parameters:
• Input: A dateTime.

Returns: The millisecond as an integer. MILLISECOND

\[
\text{millisecond}^{\text{106}} ::= \text{MILLISECOND}^{\text{106}}$
\]

referenced by:
• functionExpression^{83}

\textbf{number_to_speech:}

NUMBER_TO_SPEECH

\[
\text{number to speech}^{\text{104}} ::= \text{NUMBER_TO_SPEECH}^{\text{104}}$
\]

referenced by:
• functionExpression^{83}

\textbf{normalize:}

Normalize a file path by replacing all invalid and non-ASCII characters for use in a file path by underscore. After that, the file path is made more readable by various operations such as removal of duplicate whitespace and underscore characters.

Parameters:
• Original file path: path of the file.
• Maximum file name length: length in characters into which the normalized file name must fit.
• Allow path separator: whether to allow the path separator '/' in the normalized file name. When not, occurrences are replaced.

Returns: a normalized file path. NORMALIZE

\[ \text{normalize} ::= \text{NORMALIZE} \]

referenced by:
  • functionExpression

second:
Collect the second from a date.
Parameters:
• Input: A dateTime.

Returns: The second as an integer. SECOND

\[ \text{second} ::= \text{SECOND} \]

referenced by:
  • functionExpression

soundex:
Converts a value to the Soundex code as defined on Wikipedia.
Parameters:
• Input: Text to that retrieve the soundex value from.

Returns: A text started with a number and followed by 3 digits. SOUNDEX

\[ \text{soundex} ::= \text{SOUNDEX} \]

referenced by:
  • functionExpression

sin:
Returns the sine of the provided angle.
Parameters:
• Input: the angle to get the sine of.

Returns: A number which represents the sine of the provided angle. SIN

\[ \text{sin} ::= \text{SIN} \]

referenced by:
  • functionExpression

sqrt:
Returns the square root of the provided number.
Parameters:
- Input: the number to get the square root of.

Returns: A number which represents the square root of the provided number. SQRT

```
sqrt ::= SQRT
```

referenced by:
- functionExpression

`sqrt`

`substr`:

Gets a substring from the input.

Parameters:
- Input: text to gather the substring from.
- Start: start position.
- Length: maximum length of the substring.

Returns: The substring from the original input. SUBSTR

```
substr ::= SUBSTR
```

referenced by:
- functionExpression

`substr`

`sys_context`:

Text value of a parameter associated with a context.

Parameters:
- context: a namespace.
- parameter: name of the parameter.

Solely the namespace USERENV is available with the following parameter names:
- APPLICATION_VERSION: version of the client application.
- APPLICATION_FULL: name and version of the client application.
- APPLICATION_BUILD_EXPIRATION_DATE: build expiration date of the client application.
- AUTHENTICATION_METHOD: current authentication method.
- CLIENT_IP_ADDRESS_INTERNAL: internal IP address of the client device.
- CLIENT_IP_ADDRESS_EXTERNAL: external IP address of the client device.
- CLIENT_LOGICAL_CORE_COUNT: number of logical processor cores in the client device.
- CLIENT_MACHINE_NAME: machine name of the client device.
- CLIENT_SYSTEM_64_BIT: whether the OS is 64-bit on the client device.
- CLIENT_SYSTEM_NAME: full OS name running on the client device.
- CLIENT_SYSTEM_DIRECTORY: system directory of the client device.
- CLIENT_SYSTEM_PAGE_SIZE: system page size of the client device.
- CLIENT_VIRTUAL_MACHINE: whether the client device is a virtual machine.
- CLR_VERSION_BUILD: build version of the Common Language Runtime.
- CLR_VERSION_MAJOR: major version of the Common Language Runtime.
- CLR_VERSION_MAJOR_REVISION: major revision of the Common Language Runtime.
• CLR_VERSION_MINOR: minor version of the Common Language Runtime.
• CLR_VERSION_MIN_REVISION: minor revision of the Common Language Runtime.
• COMPANY_ID: ID of the company of current user.
• COMPANY_NAME: name of the company of current user.
• COMPANY_PHONE: phone of the company of current user.
• COMPANY_WEB_SITE: web site of the company of current user.
• DATA_CONTAINER_ALIAS: alias of active data container.
• DATA_CONTAINER_ID: ID of active data container.
• DATABASE_DESCRIPTION: description of database.
• DATABASE_FULL_NAME: full name of database.
• DATABASE_VERSION: version of database.
• LANG: ISO abbreviation for the language name of the user. Alternative:
  USER_LANGUAGE_CODE.
• MODULE: name of the client application. Alternative: APPLICATION_NAME.
• PROCESS_64_BIT: whether the OS process on the client device runs as 64-bit.
• PROCESS_COMMAND_LINE: command line used to start the OS process.
• PROCESS_CURRENT_DIRECTORY: current directory of the OS process.
• PROCESS_STACK_TRACE: current stack trace of the OS process.
• PROCESS_WORKING_SET: working set of the OS process.
• PROVIDER_DESCRIPTION: description of active data container.
• PROVIDER_DOCUMENTATION_URL: documentation (URL) of active data container.
• PROVIDER_DOWNLOADIMPLEMENTATION_URL: download driver (URL) of active data container.
• PROVIDER_NAME: name of active data container.
• PROVIDER_SHORT_NAME: short name of active data container.
• PROVIDER_TECHNICAL_DOCUMENTATION_URL: technical documentation (URL) of active data container.
• SESSION_USER: log on code of the current user. Alternative: CURRENT_USER.
• SESSIONID: session ID of current session.
• USER_DOMAIN_NAME: Windows domain name of current user.
• USER_EMAIL_ADDRESS: email address of current user.
• USER_FIRST_NAME: first name of current user.
• USER_FULL_NAME: full name of current user.
• USER_GENDER: gender of current user.
• USER_HOME_DIRECTORY: home directory of current user on client device.
• USER_INTERACTIVE: whether the current user works interactive.
• USER_PICTURES_DIRECTORY: pictures directory of current user on client device.
• USER_FAVORITES_DIRECTORY: favorites directory of current user on client device.
• USER_DESKTOP_DIRECTORY: desktop directory of current user on client device.
• USER_DOCUMENTS_DIRECTORY: documents directory of current user on client device.
• USER_PROFILE_DIRECTORY: profile directory of current user on client device.
• USER_LAST_LOGIN: time of last log on of current user.
• USER_LAST_NAME: last name of current user.
• USER_LINKED_IN: LinkedIn name of current user.
• USER_MIDDLE_NAME: middle name of current user.
• USER_MOBILE_NUMBER: mobile number of current user.
- USER_NATIONALITY: nationality of current user.
- USER_PHONE_NUMBER: phone number of current user.
- USER_PICTURE_URL: picture URL of current user.
- USER_SKYPE: Skype name of current user.
- USER_TITLE: title of current user.
- USER_TWITTER: Twitter name of current user.
- USER_WEB_SITE: personal website of current user.

Returns: Value of the parameter in the context namespace. SYS_CONTEXT

```plaintext
sys_context ::= SYS_CONTEXT
```

referenced by:
- `functionExpression` [83]

**tan:**
Returns the tangent of the provided angle.

Parameters:
- Input: the angle to get the tangent of.

Returns: A number which represents the tangent of the provided angle. TAN

```plaintext
tan ::= TAN
```

referenced by:
- `functionExpression` [83]

**times:**
Multiples one number by the second number.

Parameters:
- First: a number to multiply.
- Second: a number to multiply with.

Returns: The first number multiplied by the second number. ASTERIX

```plaintext	imes ::= ASTERIX
```

referenced by:
- `arithmeticExpression` [82]

**translate:**
Translate replaces all occurrences of each character in from_string to its corresponding character in to_string.

Parameters:
- input: The string to replace a sequence of characters with another set of characters.
- from_string: The string that will be searched for in the input.
- to_string: All characters in the from_string will be replaced with the corresponding character in the to_string

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Returns: the input with all occurrences of each character in from_string replaced by its corresponding character in to_string. TRANSLATE

```sql
translate ::= TRANSLATE
```

referenced by:
- `functiExpression`

translate_resources:
Replace all Invantive-style resources (‘{res:...}') by their translation in the current language.
Parameters:
- `txt`: The string to replace resources in.

Returns: the input with all resources replaced by their translation. TRANSLATE_RESOURCES

```sql
translate_resources ::= TRANSLATE_RESOURCES
```

referenced by:
- `functiExpression`

trim:
Trims whitespaces from both sides of the provided string.
Parameters:
- `Input`: the string from which to trim characters.

Returns: A string trimmed from whitespaces from both sides. TRIM

```sql
trim ::= TRIM
```

referenced by:
- `functiExpression`

trunc:
Calculates the integral part of a number. Unless an amount of decimals is defined, in which case it calculates to the integer with the amount of decimals or date with the amount of positions.
Parameters:
- `Input`: A number or datetime to truncate.
- `Decimals` [optional]: A number to specify how many decimals it may truncate to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The truncated input. TRUNC

```sql
trunc ::= TRUNC
```

referenced by:
- `functiExpression`
to_hex:

```
TO_HEX
  to_hex [110] ::= TO_HEX [119]
```

referenced by:

- `functionExpression` [83]

unistr:

Converts a text with unicodes to regular characters.

Parameters:

- Input: text with unicodes.

Returns: The input converted to all regular characters.

```
unistr [150] ::= UNISTR [120]
```

referenced by:

- `functionExpression` [83]

upper:

Converts provided string to uppercase.

Parameters:

- Input: the string that will be converted to uppercase.

Returns: A string converted to uppercase.

```
upper [150] ::= UPPER [120]
```

referenced by:

- `functionExpression` [83]

urlencode:

Decodes a url.

Parameters:

- Url: url to decode.

Returns: The decoded url.

```
urldecode [150] ::= URLDECODE [120]
```

referenced by:

- `functionExpression` [83]
• Url: url to encode.

Returns: The encoded url. URLENCODE

```
urlencode ::= URLENCODE
```

referenced by:
• functionExpression

unix_timestamp:
Get the UNIX epoch time of a date/time.

Parameters:
• Input: A date/time. Current date/time is used when no value is specified.

Returns: The UNIX epoch time. UNIX_TIMESTAMP

```
unix_timestamp ::= UNIX_TIMESTAMP
```

referenced by:
• functionExpression

unzip:
UNZIP

```
unzip ::= UNZIP
```

referenced by:
• functionExpression

zip:
ZIP

```
zip ::= ZIP
```

referenced by:
• functionExpression

xmlcomment:
Format a text as an XML comment.

Parameters:
• Input: the input which will be formatted as XML comment.

Returns: A text with the input as XML comment. XMLCOMMENT

```
xmlcomment ::= XMLCOMMENT
```

referenced by:
• functionExpression
xmldecode:
Returns the XML decoded input.
Parameters:
  - Input: the input which will be decoded into XML.
Returns: An object which is the XML decoded input. XMLDECODE

xmlencode:
Returns the XML encoded input.
Parameters:
  - Input: the input which will be encoded into XML.
Returns: An object which is the XML encoded input. XMLENCODE

xmlelement:

xmlelement:

xmltransform:
Applies an XSL style sheet to the XML instance.
Parameters:
  - XML: XML type instance to be transformed with the XSL style sheet.
  - Style sheet: The XSL style sheet to apply.
Returns: The XML instance with the style sheet applied to it. XMLTRANSFORM

xmlformat:
Pretty-print xml text.

Parameters:
  - Xml: xml to pretty-print.

Returns: The pretty-printed XML text. XMLFORMAT

xmlformat := XMLFORMAT

referenced by:
  - functionExpression

httpget:

Collects all data from the URL as binary data.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
  - URL: the URL to collect the data from.

Returns: The collected data as an byte array. HTTPGET

httpget := HTTPGET

referenced by:
  - functionExpression

httpget_text:

Collects all data from the URL as text.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
  - URL: the URL to collect the data from.
  - Encoding: the encoding from the data to receive, which is by default UTF8.

Returns: The collected data as text. HTTPGET_TEXT

httpget_text := HTTPGET_TEXT

referenced by:
  - functionExpression

httppost:

HTTPPOST

httppost := HTTPPOST

referenced by:
  - functionExpression
quarter:
Collect the quarter from a date.

Parameters:
- Input: A dateTime.

Returns: The quarter as an integer. QUARTER

    quarter[114] ::= QUARTER[114]

quote_ident:
QUOTE_IDENT

    quote_ident[114] ::= QUOTE_IDENT[114]

quote_literal:
QUOTE_LITERAL

    quote_literal[114] ::= QUOTE_LITERAL[114]

quote_nullable:
QUOTE_NONNULL

    quote_nullable[114] ::= QUOTE_NONNULL[114]

user:
Gets the user log on code.

Returns: The user log on code.

USER

    user[114] ::= USER[114]
year:
Collect the year from a date.
Parameters:
- Input: A dateTime.
Returns: The year as an integer. YEAR
  \[ \text{year} \] ::= \text{YEAR} \\
referenced by:
- functionExpression

to_binary:
TO_BINARY
  \[ \text{to\_binary} \] ::= \text{TO\_BINARY} \\
referenced by:
- functionExpression

to_char:
Converts a value into text.
Parameters:
- Input: value to convert.
Returns: The input converted to text. TO_CHAR
  \[ \text{to\_char} \] ::= \text{TO\_CHAR} \\
referenced by:
- functionExpression

to_date:
Converts a value into a datetime.
Parameters:
- Input: value to convert.
Returns: The input converted to a datetime. TO_DATE
  \[ \text{to\_date} \] ::= \text{TO\_DATE} \\
referenced by:
- functionExpression

to_guid:
Converts a value into a guid.
Parameters:
- Input: value to convert.
Returns: The input converted to a guid.

Converts a value into a number.

Parameters:
- Input: value to convert.

Returns: The input converted to a number. TO_GUID

```
to_guid ::= TO_GUID
```

referenced by:

- xmlTableSpec

intervalConstant:
A constant interval value, reflecting the time span between two dates. The string constant consists of an integer number and unit of time, taken from the following list:
- Millisecond,
- second,
- minute,
- hour,
- day,
- week, and
- year.

The units may be postfixed with an 's' without changing meaning, like 'years'.
Valid interval values are for example: "5 seconds", "20 hours" and "1 year". There is no support for combined intervals such as "30 minutes and 30 seconds".

**INTERVAL** stringConstant

\[
\text{intervalConstant} ::= \text{INTERVAL} \text{stringConstant}

pSqlBlock:
A PSQL block is a structure to define procedural logic. It can contain both procedural logic as well as SQL statements like "select".

pSqlDeclareSection pSqlBody
pSqlBlock := pSqlDeclareSection? pSqlBody

referenced by:
- pSqlBlockOrStatement
- pSqlStatement

pSqlDeclareSection:
A PSQL declare section defines one or more local variables, which are available in the block and nested blocks.

DECLARE pSqlDeclaration
pSqlDeclareSection := DECLARE pSqlDeclaration+

referenced by:
- pSqlBlock

pSqlDeclaration:

pSqlItemDeclaration
pSqlDeclaration := pSqlItemDeclaration

referenced by:
- pSqlDeclareSection

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
An item declaration defines one named variable, based upon data type. The initial value can be added as a constant.

```
variableName dataType ASSIGNMENT_OPERATOR constant BATCH SEPARATOR
```

```
pSqlItemDeclaration ::= variableName \(\text{ dataType} \) \(\text{ ASSIGNMENT_OPERATOR}\) constant \(\text{ BATCH}\) \(\text{ SEPARATOR}\)
```

referenced by:
- \(\text{ pSqlDeclarati}\)on[127]

**pSqlBody:**

A PSQL body contains the procedural logic as well as SQL statements. Variables must have been declared beforehand.

```
BEGIN pSqlStatement END BATCH SEPARATOR
```

```
pSqlBody ::= BEGIN \(\text{ pSqlStatement}\) END \(\text{ BATCH}\) \(\text{ SEPARATOR}\)
```

referenced by:
- \(\text{ pSqlBlock}\)[127]

**pSqlStatement:**

A number of basic PSQL statements are available.

```
pSqlAssignmentStatement pSqlExecuteImmediateStatement pSqlIfStatement
```

```
pSqlBlockOrStatement
```

```
pSqlBody
```

```
sqlOrPSqlStatement
```

```
pSqlStatement ::= pSqlAssignmentStatement \| pSqlExecuteImmediateStatement \| pSqlIfStatement
```

```
| pSqlLoopStatement \| pSqlNullStatement \| pSqlBlock \| sqlStatement \| BATCHSEPARATOR
```

referenced by:
- \(\text{ pSqlBlockOrStatement}\)[128]
- \(\text{ pSqlBody}\)[128]
- \(\text{ sqlOrPSqlStatement}\)[42]

**pSqlBlockOrStatement:**

A PSQL block or statement defines a procedural step or a SQL statement to be executed.

```
pSqlBlock pSqlStatement
```

```
pSqlBlockOrStatement ::= pSqlBlock \| pSqlStatement
```

referenced by:
- \(\text{ pSqlBlockOrStatements}\)[129]
pSqlBlockOrStatements:

```
pSqlBlockOrStatement
   pSqlBlockOrStatements \| pSqlBlockOrStatement
   ::= pSqlBlockOrStatement +
```

referred by:
- pSqlElseIfExpression
- pSqlForNumberLoopStatement
- pSqlForRecordLoopStatement
- pSqlIfStatement
- pSqlWhileLoopStatement

pSqlNullStatement:

The null-statement is a NOP-statement (No Operator). The use of the null-statement is necessary when a PSQL statement is needed, but no activity needs to be performed such as with an if statement. The null-statement also makes explicit that a developer has considered the actions needed and found that no action applies to a specific scenario. This leads to improved code documentation.

```
NULL BATCHSEPARATOR
   pSqlNullStatement
   ::= NULL BATCHSEPARATOR
```

referred by:
- pSqlStatement

pSqlAssignmentStatement:

The assignment statement assign a new value to a variable. To assign the results of a SQL query to a value, use a select ... into ... statement.

```
variableName ASSIGNMENT_OPERATOR expression BATCHSEPARATOR
   pSqlAssignmentStatement
   ::= variableName ASSIGNMENT_OPERATOR expression BATCHSEPARATOR
```

referred by:
- pSqlStatement

pSqlExecuteImmediateStatement:

The execute immediate PSQL statement enables the use of SQL statements that are compiled at runtime. For instance dynamic DDL statements can not always be executed on compiled time and the execute immediate enables these.

```
EXECUTE IMMEDIATE expression BATCHSEPARATOR
   pSqlExecuteImmediateStatement
   ::= EXECUTE IMMEDIATE expression BATCHSEPARATOR
```

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
pSqlIfStatement:
The if-statement performs conditional logic. When the boolean expression after if holds, the
PSQL block after the 'then' will be executed. Other branches can be specified using an elsif.
Otherwise, and only when specified, the logic after the else is executed.

```
IF booleanExpression THEN pSqlBlockOrStatements pSqlElsIfExpression ELSE pSqlBlock-
OrStatements END IF BATCH SEPARATOR
```

pSqlElsIfExpression:
ELSEIF booleanExpression THEN pSqlBlockOrStatements

```
ELSIF booleanExpression THEN pSqlBlockOrStatements
```

pSqlLoopStatement:
A variety of PSQL statements for loops are available.

```
pSqlForNumberLoopStatement pSqlForRecordLoopStatement pSqlWhileLoopStatement
```

pSqlForNumberLoopStatement:
This PSQL integer loop statement iterates over a range of integer values, executing PSQL
statements for each iterated value. The iterations goes from the first value to the last value in
increments of 1. The iterations go backward in decrements of 1 when 'reverse' is specified.

```
FOR variableName IN REVERSE numericConstant variableName DOT DOT numericCon-
stant variableName LOOP pSqlBlockOrStatements END LOOP BATCH SEPARATOR
```
pSqlForNumberLoopStatement::= FOR variableName IN REVERSE? ( numericConstant | variableName ) DOT DOT ( numericConstant | variableName ) LOOP pSqlBlockOrStatements END LOOP

pSqlForRecordLoopStatement:
This PSQL result set loop statement iterates over a result set returned by an Invantive SQL query. The PSQL statements are executed for each record. The record’s specific values can be retrieved using the variable.

FOR variableName IN PARENTHESES_OPEN selectStatement PARENTHESES_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

pSqlWhileLoopStatement:
This PSQL while loop statement executes PSQL statements as long as the specified boolean condition evaluates to true at loop end.

WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

variableName:
IDENTIFIER

3.2 Providers

The providers described here are available on all platforms.

3.2.1 Provider Atom10

Atom version 1.0.

Code for use in settings.xml: Atom10

Alias: atom

Status: Production

Available in Editions: Paid, Open Data, Community

3.2.2 Provider AutoTask

AutoTask service management.

Code for use in settings.xml: AutoTask

Alias: autotask

Status: Non-production

Available in Editions: Paid

Non-technical Documentation: http://severa.visma.com

3.2.3 Provider CbsNl

Centraal Bureau voor de Statistiek.

Code for use in settings.xml: CbsNl

Alias: cbsnl

Status: Production

Available in Editions: Paid, Open Data, Community

Provider Attributes

The following provider attributes are available for CbsNl:

### 3.2.8 Provider Dropbox

Dropbox information.

Code for use in settings.xml: Dropbox
3.2.9 Provider Dummy

Fixed memory provider with fixed data set for regression testing and demos.

Code for use in settings.xml: Dummy

Alias: dummy

Status: Production

Available in Editions: Paid

Updated: 08-02-2019 16:03 using Invantive SQL version 17.31.26-BETA+1898.

**Provider Attributes**

The following provider attributes are available for Dummy:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connec-</th>
<th>Set from Set</th>
<th>Set from Pro-</th>
</tr>

3.2.13 Provider ExactOnlineAll
Exact Online (XML, REST and undocumented).
Code for use in settings.xml: ExactOnlineAll
Alias: eol
Abbreviation: eol
Status: Production
Available in Editions: Paid
String-comparison is Case-sensitive: true
Use Catalog in Full Name: true
Use Schema in Full Name: true
Partition Column: division

Updated: 02-12-2019 15:47 using Invantive SQL version 17.33.216-BETA+2512.
Technical Documentation: https://developers.exactonline.com

**Provider Attributes**

The following provider attributes are available for ExactOnlineAll:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>
<th>Set from Providers File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>api-client-id</td>
<td>The client ID is a unique identifier of your application. It is generated by registering an application.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-client-secret</td>
<td>The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-refresh-token</td>
<td>Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-redirect-url</td>
<td>The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>totp-secret</td>
<td>Shared secret key to generate one-time password using TOTP RFC 6238. For improved security, manually enter the one-time password asked during login.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>

</table>

### 3.2.16 Provider Freshdesk

Freshdesk, customer happiness for exceptional customer service.

Code for use in settings.xml: Freshdesk

Alias: freshdesk
Authentication

Authentication can be done using one of the following two alternatives:

1. Using the user log on code, password and company also used on the Freshdesk website.
2. Using an API key and company.

Authentication using user log on code and password is recommended for general use. The company is the name before '.freshdesk.com' in the URL used to log on to Freshdesk in a browser.

The API key can be found in the 'Edit Profile' page in Freshdesk, as described on https://support.freshdesk.com/support/solutions/articles/225435-where-can-i-find-my-api-key.

Usage Limits

Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per hour depends on your Freshdesk plan. The default usage limits vary between 1,000 and 5,000 calls per hour. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Provider Attributes

The following provider attributes are available for Freshdesk:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>

### 3.2.17 Provider Ftp

FTP.

Code for use in settings.xml: Ftp

Alias: ftp

Abbreviation: ftp

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

### Provider Attributes

The following provider attributes are available for Ftp:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Providers File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>

### 3.2.18 Provider GitLab

GitLab version control in the cloud or on-premises.

Code for use in settings.xml: GitLab

Alias: GitLab

Status: Production

Available in Editions: Paid

Technical Documentation: [https://docs.gitlab.com/ee/api/](https://docs.gitlab.com/ee/api/)

Non-technical Documentation: [https://gitlab-apps.com](https://gitlab-apps.com)

### 3.2.19 Provider IbmDb2Udb

IBM DB2/UDB.

Code for use in settings.xml: IbmDb2Udb

Alias: db2

Status: Production

Available in Editions: Paid

Additional Driver to install: [https://support.invantive.com/download-driver-ibm-db2](https://support.invantive.com/download-driver-ibm-db2)

### 3.2.20 Provider InMemoryStorage

Session-specific temporary storage of result sets.

Code for use in settings.xml: InMemoryStorage

Alias: inmem

Status: Production

Available in Editions: Paid

### 3.2.24 Provider KeePass

Security-sensitive storage of keys.

**Code for use in settings.xml:** KeePass

**Alias:** KeePass

**Abbreviation:** kp

**Status:** Non-production

**Available in Editions:** Paid

**String-comparison is Case-sensitive:** true

**Use Catalog in Full Name:** true

**Use Schema in Full Name:** true

**Updated:** 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

### Connector Attributes

The KeePass connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-bytes</td>
<td>Approximate maximum size in bytes of batch when bulk inserting</td>
<td>10000000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per batch when bulk inserting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from SQL Statement</td>
<td>Set from Connectors File</td>
<td>Set from Log On</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
<td>-----------------------------</td>
<td>------------------------</td>
<td>--------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

3.2.30 Provider Mendix

Mendix version control in the cloud or on-premises.

Code for use in settings.xml: Mendix

Alias: Mendix

Status: Non-production

Available in Editions: Paid

Technical Documentation: https://docs.mendix.com/ee/api/

Non-technical Documentation: https://mendix-apps.com

3.2.31 Provider MicrosoftGraph

Microsoft Graph (as used by Office 365).

Code for use in settings.xml: MicrosoftGraph

Alias: graph

Status: Production

Available in Editions: Paid

Technical Documentation: https://graph.microsoft.io/en-us/

3.2.32 Provider MySql

Oracle MySQL.

Code for use in settings.xml: MySql

Alias: mysql

Status: Production

Available in Editions: Paid
Additional Driver to install: [https://support.invantive.com/download-driver-mysql](https://support.invantive.com/download-driver-mysql)

### Provider Attributes

The following provider attributes are available for MySql:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>

### 3.2.34 Provider NmbrsNL

Payrolling and HR management.

Code for use in settings.xml: NmbrsNL

Alias: nmbrs

Abbreviation: nms

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Partition Column: COMPANY_CODE

Updated: 14-05-2020 17:13 using Invantive SQL version 20.1.36-BETA+2798.

Technical Documentation: [https://api.nmbrs.nl](https://api.nmbrs.nl)

### Provider Attributes

The following provider attributes are available for NmbrsNL:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Providers File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>minimum-length-text</td>
<td>Extend all text columns to this length to allow processing of XML that uses longer text values than the XSD specifies.</td>
<td></td>
<td>✓</td>
<td></td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>api-url</td>
<td>URL of Nmbrs web service</td>
<td></td>
<td>✓</td>
<td></td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>

3.2.44 Provider PostgreSQL: PostgreSQL.

PostgreSQL.

Code for use in settings.xml: Postgres

Alias: pg

Status: Production

Available in Editions: Paid

Additional Driver to install: https://support.invantive.com/download-driver-postgresql

**Provider Attributes**

The following provider attributes are available for Postgres:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per page when bulk inserting</td>
<td>1000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>command-timeout-sec</td>
<td>Number of seconds after which a command times out</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>database</td>
<td>Database to open when connecting</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-forward-filters-to-data-containers</td>
<td>Whether to forw ard filters to data containers.</td>
<td>True</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-shuffle-fetch-results-data-containers</td>
<td>Whether to shuffle results fetched from data containers.</td>
<td>False</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-use-cache</td>
<td>Whether to cache the results of a query.</td>
<td>True</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-length-identifiers</td>
<td>Non-default maximum length in characters of identifier names.</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-number-of-pooled-connections</td>
<td>Maximum number of concurrent pooled connections.</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-pooled-connection-ms</td>
<td>Maximum time in ms to wait for acquiring a free connection from a pool of connections.</td>
<td>30000</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-unpooled-connection-ms</td>
<td>Maximum time in ms to wait for acquire a free connection when there is no connection pooling.</td>
<td>60000</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>npgsql-log</td>
<td>Whether to log messages of the npgsql provider</td>
<td>False</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>preferred-number-of-pooled-connections</td>
<td>Preferred number of concurrent pooled connections.</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>prefix-bind-variable-in-list</td>
<td>Prefix for bind variables used in an IN-list</td>
<td>i</td>
<td></td>
<td>✓</td>
<td>✓</td>

### 3.2.45 Provider RdwNL: RDW (NL) Information.

RDW (NL) information.

Code for use in settings.xml: RdwNL

Alias: rdwnl

Status: Production

Available in Editions: Paid, Open Data, Community

Technical Documentation: [https://www.rdw.nl/opendata/Paginas/default.aspx](https://www.rdw.nl/opendata/Paginas/default.aspx)

## Provider Attributes

The following provider attributes are available for RdwNL:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from</th>
<th>Set from</th>
<th>Set from</th>
</tr>
</thead>
<tbody>
<tr>
<td>api-url</td>
<td>URL to access the API.</td>
<td></td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-max-tries</td>
<td>Maximum number of tries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-sleep-initial-ms</td>
<td>Initial sleep in milliseconds between retries when the Internet connection seems down</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from SQL-Statement</td>
<td>Set from Providers File</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>---------------</td>
<td>-----------------------------</td>
<td>------------------------</td>
<td>------------------------</td>

### 3.2.53 Provider StackExchange: StackExchange

StackExchange.

Code for use in settings.xml: StackExchange

Alias: StackExchange

Status: Production

Available in Editions: Paid, Open Data, Community

Technical Documentation: [https://api.stackexchange.com](https://api.stackexchange.com)

Non-technical Documentation: [https://stackexchange-apps.com](https://stackexchange-apps.com)

**Provider Attributes**

The following provider attributes are available for StackExchange:
<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>api-client-id</td>
<td>The client ID is a unique identifier of your application. It is generated by registering an application.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-client-secret</td>
<td>The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

<td>✓</td>
</tr>
</tbody>
</table>

3.2.55 Provider Teamleader: Teamleader CRM.

Teamleader is a cloud solution for customer management. Teamleader includes CRM as well as project and tickets. Teamleader can be extended by defining custom fields on several core concepts.

Code for use in settings.xml: Teamleader

Alias: teamleader

Abbreviation: tlr

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Updated: 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

**Documentation**

Authentication

Authentication can be done using one of the following two alternatives:

1. Using the user log on code and password also used on the Teamleader website.
2. Using an API group and API secret.

Authentication using user log on code and password is recommended for general use. The user must have access to all functionality since by default all so-called 'scopes' are requested. The scopes can be manually entered to be able to log in with a restricted accounts. Please provide a space-separated list chosen from companies, contacts, deals, departments, events, invoices, products, projects, quotations, subscriptions, tickets, todos, users.

The API group and secret can be found on https://app.teamleader.eu/apiwebhooks.php?show_key.

Usage Limits
Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per 5 seconds is 25. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Custom Fields

Custom fields for which one value can be entered on an object are added to the table representing the object. For instance, a custom field 'needsaudit' on 'project', will be added as a column 'c_needsaudit' on the 'project' table. The name of the additional column directly derives from the custom field name. Almost all changes, including adding numbers or reading characters, will result in the data model being changed.

Custom fields which can have no, one or multiple values ('set' custom fields) are reflected in the data model by tables with a name constructed of the object name, an underscore plus the name of the custom field. For example, a custom field named 'Multiple Selection' on 'Task' will add a table 'task_multipleselection' to the data model.

Custom fields are unique to each Teamleader environment. When the existence of specific custom field is not guaranteed, please use generic solutions like the tables 'CustomFieldDefinitions', 'custom_fields', 'custom_field_options', 'custom_field', 'Custom_Field-\_s\_All', 'Custom_Field_Types' and their object-specific custom field value tables like 'ticket_custom_field_values_by_id'.

Connector Attributes

The Teamleader connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>

**3.2.73 Providers**

The providers described here are available on all platforms.
3.3 Configuration

3.3.1 Network

The list of available databases is maintained in so-called 'settings.xml' files. These file names all start with 'settings' and end with '.xml'.

Interactive and OS-Applications

A default file 'settings.xml' is placed in the user's home directory folder 'Invantive' during discovery of databases in interactive or OS-applications. Additional settings files may be placed in this folder too.

Web Applications

For web applications, the folder App_Data/Config must contain the settings.xml files. Additional settings files may be placed in this folder too.

Additional Locations

Using the environment variable INVANTIVE_SETTINGS_FILE_PATH, you can specify a different file name and path for the default settings.xml file.

Settings.xml is not searched for at other locations.

Structure

The settings files all have the following structure in XML format; The full specification is available in xsd format and online.

3.3.2 License

The license key controls the availability of functionality, providers and limits of your Invantive products. A license key is associated with a license contract. A license contract has a unique code consisting of a 'L' plus a number. Each license contract can have multiple license keys.
License keys are automatically revoked when they have not been used for three months. When a license contract concerns a subscription, the contract is automatically ended when it has not been used for three months.

**Interactive and OS-Applications**

For interactive and OS-applications, a file named ‘invantive.lic’ is searched within the user’s home directory folder ‘Invantive’. The license key for use of Invantive products is normally stored within the product’s configuration files after loading it through the user interface of the product.

**Web Applications**

For web applications, a file named ‘invantive.lic’ is searched within the folder ‘App_Data/Config’.

**Additional Locations**

Using the environment variable INVANTIVE_LICENSE_FILE_PATH, you can specify a deviating location for the default license file ‘invantive.lic’.

3.3.3 Logging

3.3.3.1 Trace

During use of the products, a continuous stream of relevant trace messages is being sent to the trace listeners. On Microsoft Windows, you can use the Microsoft program ‘dbgview.exe’ to see the trace messages.

Trace options are only available when the environment variable 'INVANTIVE_TRACE_ACTIVE' is set to any non-empty value.

The trace messages are also stored in trace files when the environment variable 'INVANTIVE_TRACE_TO_FILE' is set to 'true'.

The default location of the trace files is the folder for temporary files on interactive and OS-applications. The default location for web applications is 'App_Data\Trace'. An alternative folder for trace files can be specified by setting the environment variable 'INVANTIVE_TRACE_FOLDER'.

A limited amount of information is sent to the trace when an error occurs. The call stack and the natural key can be sent to trace by setting the environment variable 'INVANTIVE_TRACE_OWN_EXCEPTION_DETAILS' to 'true'.

**Log to Amazon CloudWatch**

The trace can be logged to Amazon CloudWatch by configuring the following environment variables:

- INVANTIVE_TRACE_TO_CLOUDWATCH: change to True to activate logging to CloudWatch
- INVANTIVE_TRACE_CLOUDWATCH_ACCESS_KEY: the access key as generated on Amazon.
- INVANTIVE_TRACE_CLOUDWATCH_SECRET_KEY: the corresponding secret key.
- INVANTIVE_TRACE_CLOUDWATCH_REGION: the geographical region to log the messages.
• **INVANTIVE_TRACE_CLOUDWATCH_GROUP**: the log group to use for logging.

The identity associated with the access key must allow logging to CloudWatch.

Amazon CloudWatch logging is rate limited. Messages may not be logged during periods of intensive activity.

The log format is JSON-based as shown:

![CloudWatch Log Group](image)

**Microsoft Power BI**

When used in combination with Microsoft Power BI, please note that Power BI tries to disable all trace logging by third party drivers. Invantive SQL has limited tracing available through Power BI. To activate: in Power BI go to 'Options and Settings', then 'Options' and choose 'Diagnostics' in the Global group. Place a checkmark next to 'Enable tracing'. This setting will remain effective till you restart Microsoft Power BI.

**Direct Trace**

Trace messages generated by Invantive can also be logged to file outside the Microsoft .NET trace mechanism. This is called "direct trace".

The advantages of direct trace are:

- Direct trace starts very early in program execution, even before the normal trace mechanism is activates. It therefore allows analysis of start-up problems.
- Direct trace works independent of the normal trace mechanism. It is therefore available even when the environment manages Microsoft .NET trace, such as with Power BI.

The disadvantages of direct trace are:

- The use of direct trace reduces performance significantly. Therefore only enable direct trace when needed.

To activate direct trace, please set the environment variable **INVANTIVE_DIRECT_TRACE_FILE_PATH** to the file path of the intended log file.

It is recommended to include the placeholder '{PID}' in the file name when you expect to run multiple OS-processes with direct trace.

A commonly used setting for **INVANTIVE_DIRECT_TRACE_FILE_PATH** is `c:\temp\invantive-direct-trace-{PID}.log`. 
Mac OSX and Linux

Set the environment variable `COMPlus_DebugWriteToStdErr` to write trace messages to the console of Microsoft .NET Core applications:

```bash
eexport COMPlus_DebugWriteToStdErr=1
```

Note that the Microsoft .NET Core implementation on Mac OSX and Linux are restrained in the default stack size. On StackOverflowException such as with Exact Online, please increase stacksize first using:

```bash
eexport COMPlus_DefaultStackSize=10000000
```

### 3.3.3.2 Execution Log

Every completed execution of an Invantive product appends an entry to the local execution log. The execution log is in XML-format and located by default at `%USERPROFILE%\executionlog.xml`

The name and location of the execution log can be altered by placing the full path and file name in the environment variable `INVANTIVE_EXECUTION_LOG_FILE`.

The root tag `EXECUTIONLOGS` contains an `EXECUTIONLOG` for every execution once finished. The following elements are available:

- **VERSION**: the record format, always '1'.
- **MESSAGEUID**: the UID of the message as registered on Invantive Cloud.
- **IIID**: the Invantive Installation ID of the device.
- **SESSIONID**: the ID of the session.
- **LICENSECODE**: the code of the subscription contract.
- **LICENSEKEYID**: the numeric ID of the license key.
- **MACHINENAME**: the name of the device.
- **EXECUTABLENAME**: the name and path of the executable.
- **APPLICATIONNAME**: the name of the Invantive application.
- **APPLICATIONVERSION**: the version of the Invantive application.
- **USERNAME**: the name of the operating system user.
- **PROCESSID**: the ID of the OS process.
- **STARTTIMEUTC**: the start time of the process (UTC).
- **ENDTIMEUTC**: the end time of the process (UTC).
- **EXITCODE**: the exit code of the process.
- **EXITLEVEL**: the textual description of the exit code.
- **EXITMESSAGECODE**: the message code associated with the execution exit.
- **ISHEADLESS**: whether the proces ran headless.
- **COMPUTERMANUFACTURER**: the name of the device’s manufacturer.
3.3.4 Debugging
Invantive software products contain a number of features to aid analysis of problems.

3.3.4.1 Translations
During use of the products, the user interface is adapted to the user interface language based upon the environment.

The translation involves replacing so-called "resource codes" by their translation.

The translation can be disabled by setting the environment variable 'INVANTIVE_NO_TRANSLATE' to a non-empty value.

4 Invantive SQL for Windows
The Windows-specific features of Invantive SQL are documented in this section.

4.1 Internal Consistency Checks
Invantive SQL executes many internal consistency to ensure correctness of the results. Some of these consistency checks are only done during testing phases for reasons such as performance. These checks are automatically checked on testing environments and excluded on production environments.

However, during test or production use you can explicitly disable or enable these checks by setting environment variables to the value 'true' or 'false'. The checks can individually be disabled or enabled, or all together.

To explicitly enable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to true. To explicitly disable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to false.

First determine with help of support the message code to explicitly enable or disable a consistency check. Then set the environment variable INVANTIVE_CHECK_<message code> to the correct value.
