3.2.71 Provider Xaf32: XML Auditfile Financieel version 3.2 .............. 223
1 Invantive Data Access Point

1.1 Introduction
Invantive Data Access Point is a web-based solution for exchanging data with over 50 platforms using Invantive SQL. Using popular output formats such as JSON, XML and HTML it is also used to develop interactive websites on top of these platforms.

1.2 Endpoints
Invantive Data Access Point supports a number of endpoints:
- /Preset: execute a preset stored in a file on the server. The preset contains query, format, action, XSL, database and content type.
- /Results: execute a query provided in the HTTP requests and return the results.
- /Transform: first perform the action as with /Results and then apply a XSL transformation.
- /Logoff: log off the current user by releasing all credentials managed by Data Access Point for the web session.
- /Ping: light-weight call to check whether the service is running.

When no endpoint is presented, a default page is shown which allows you to enter a query to be run against a database in the group 'PUBLIC'.

1.3 Request Parameters
Invantive Data Access Point supports a list of pre-defined URL parameters for which a value can be supplied as GET or POST parameters. The following pre-defined parameters are supported:
- connection: name of the database to use, in the format 'GROUP\DATABASE'.
- query: SQL statement(s) to execute.
- printparameters: flag whether to print the parameters and their values in the output ('true' for yes, 'false' for no, default is no).
- includeheaders: flag whether to include the headers in the output ('true' for yes, 'false' for no, default is no).
- usetechnicalheaders: flag whether to use technical headers instead of functional headers in the output ('true' for yes, 'false' for no, default is no).
- format: output format in which the results must be presented (Html, Xml, Json, JsonDataSet, Atom, Rss, Csv, Tsv, Text, Xlsx, MsExcel, Data, default is Html).
- xsl: Filename or URL of XSL to apply on the output, preferrably located in the Templates folder.
- contenttype: Content type of the output.
- dispositiontype: Disposition type of the output.
- preset: use a specific preset configuration defined on the server and located by default in the Templates folder.

The value of all other GET and/or POST parameters provided will be bound as parameters to the SQL statement(s).
POST parameters take precedence above GET parameters.

**RSS and Atom Format**

For RSS and Atom format, please using the following column aliases: `content`, `title`, `id` and `updated`.

**Data Format**

The data format returns a binary download, such as a ZIP file.

For Data format, please using the following column aliases: `Contents`, `FileName`, `ContentCreationDate`, `DispositionType` and `ContentType`.

**1.4 Transferring Credentials**

Credentials for the database chosen can be provided in various ways.

**Explicit Logon Credentials**

The logon code and password can be provided as parameters named 'user' and 'password'.

**Basic Authentication**

When present, a header named "Authorization" or "HTTP_AUTHORIZATION" is used for Basic Authentication. Logon code and password are taken from the header value following W3C Standards for Basic Authentication.

The authentication realm with Basic Authentication matches the database name when present and "Invantive Data Access Point Default" otherwise.

When Basic Authentication and Explicit Logon Credentials are combined, the logon codes must match. Otherwise, an error is returned.

**OAuth Code Grant Flow Preauthenticated**

The value of the X-Refresh-Token header is used to authenticate on the OAuth Code Grant Flow as specified for the database chosen in the settings.xml. When not specified as a header, the values of a GET or POST parameter with that name will be used.

**OAuth Code Grant Flow Interactive HTML**

In general, it is not necessary to make changes to accomodate the Code Grant Flow with a normal HTML site based upon Data Access Point creating pages one-by-one. When necessary, please use the '/token' path with the code and returnUrl parameters to authenticate.

**OAuth Code Grant Flow Interactive AJAX**

The '/auth' path allows AJAX calls to redirect to a log on page, returning JSON which can be evaluated from code like:

```json
{
    // Get user information for picture and name in header.
    //
    var url = "auth?preset=nl-some-query" + "&returnUrl=" + encodeURIComponent(window.location.href);
```
$scope.spinnerGet = $http.get(url)
.then
  ( function successCallback(response)
    { var isAuthenticated = response.data.isAuthentic-
     ated;
      var authenticationUrl = response.data.authentica-
     tionUrl;

      if (isAuthenticated)
      {
        // Get data.
        // $scope.spinnerGet = $http.get("Preset?preset=nl-
        some-query")
        .then
          ( function successCallback(response)
            { var me = response.data.Res-
              ults[0].Data[0];
                var image = me.THUMBNAILPICTURE;
                var imageFormat = me.THUMBNAILPICTUREFORMAT;

                ...
              }, function errorCallback(response)
              { alert('Could not load user informa-
              tion.');
              }
          );
      }
      else
      { window.location.href = authenticationUrl;
      }
    }, function errorCallback(response)
    { alert('Could not load authentication informa-
    tion.');
    }
  );

1.5 Special Cases
A number of special cases exist.

1.5.1 Transferring Refresh Token to Zoho Reports
The 2018 releases of Zoho Reports allow you to retrieve data using a URL with a mix of para-

eters specified as:
• Headers
• GET parameters
• POST parameters

All three categories of parameters are handled by the Zoho backend. However, a number of non-industry standard restrictions apply:
• The parameter value may not contain an exclamation mark ('!').
• The parameter value length may not exceed 240 characters.

Specification of a refresh token such as for Facebook or Exact Online is there not possible in general; they can be up to 1.000 characters and most of them contain an exclamation mark.

As a workaround, you can transport the refresh token to Data Access Point directly from Zoho using one of the following workarounds:

• When no exclamation mark is present in your refresh token: split the value for the X-Refresh-Token into multiple parts (at most 10). Provide the values by adding a header "X-Refresh-Token-Part" plus a number from 1 to 10 to the list of parameters and assign each one a piece of the refresh token. The resulting parameters will be named "X-Refresh-Token-Part1", "X-Refresh-Token-Part2", etc.

• When an exclamation mark is present in your refresh token: base64 encode the refresh token and split the base64 encoded value into multiple parts (at most 10). Provide the values by adding a header "X-Refresh-Token-Part" plus a number from 1 to 10, plus a prefix "-Base64" to the list of parameters and assign each one a piece of the refresh token. The resulting parameters will be named "X-Refresh-Token-Part1-Base64", "X-Refresh-Token-Part2-Base64", etc.

On reception, the parts will be assembled together and considered as follows to be used as a refresh token:
• When a X-Refresh-Token header or parameter is present, it will be preferred.
• When a non-base64 encoded value is present, that one will be used.
• Otherwise, the value provided by base64 encoding will be used as a refresh token.

1.5.2 Process Files

Files can be presented for use in Invantive SQL using the following steps:
• Use one POST parameter per file.
• Define in the preset a parameter of type ByteArray with a name identical to the POST parameter.
• The parameter can be used in Invantive SQL.

Example

HTML

```html
<body>
    <form action="/Preset?preset=some-preset" method="POST" enctype="multipart/form-data">
        <ul>
```

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Preset

<?xml version="1.0" encoding="utf-8" ?>
<PresetInfo>
  <Code>ENTRIES</Code>
  <SqlFile>file.sql</SqlFile>
  <Format>Xml</Format>
  <Action>Transform</Action>
  <Xsl>ecotaksen-all.xsl</Xsl>
  <XslOutputTranslate>true</XslOutputTranslate>
  <LogRequestProgress>true</LogRequestProgress>
  <ConnectionName>ECOTAKSEN\MAIN</ConnectionName>
  <ParameterValues>
    <Parameter><Name>par</Name><DotnetDataType>int32</DotnetDataType><ForceValue>true</ForceValue><Value>25</Value></Parameter>
  </ParameterValues>
</PresetInfo>

SQL

```sql
select *
from exceltable
  ( table 'Sheet1'
      passing :upload_file
      columns some_column varchar2 position 1
  )
```

1.6 Presets

A preset is a file preferably in the Templates folder that pre-defines a number of settings for an interaction. The format is based upon the following XML structure:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<PresetInfo>
  <Code>ENTRIES</Code>
  <SqlFile>file.sql</SqlFile>
  <Format>Xml</Format>
  <Action>Transform</Action>
  <Xsl>ecotaksen-all.xsl</Xsl>
  <XslOutputTranslate>true</XslOutputTranslate>
  <LogRequestProgress>true</LogRequestProgress>
  <ConnectionName>ECOTAKSEN\MAIN</ConnectionName>
  <ParameterValues>
    <Parameter><Name>par</Name><DotnetDataType>int32</DotnetDataType><ForceValue>true</ForceValue><Value>25</Value></Parameter>
  </ParameterValues>
</PresetInfo>
```
<Parameter><Name>upload_file</Name><DotnetDataType>ByteAr-ray</DotnetDataType></Parameter>
</ParameterValues>

with the following meaning:

- the optional module code is registered as 'Code'.
- the SQL file (SqlFile) is preferably located also in the Templates and the contents of this file will be used as a pre-set for the request parameter 'query'.
- As an alternative you can provide a SQL statement in the preset, using SqlStatement.
- the format (Format) has the same meaning as the request parameter 'format'.
- the action (Action) has the same meaning as the endpoints Results and Transform. Other values are not supported.
- the xsl (Xsl) is the name of an XSL-file which is used in combination with the format XML. It defines the mapping through which the XML is processed. Many XSL transformation parameters are available.
- the XslOutputTranslate specifies whether to apply XSL transformation.
- the IncludeHeaders specifies whether to add headers to the output where applicable. The associated request parameter is 'includeheaders'
- the HeaderFormat specifies what type of headers to include and can be '{name}' for a technical name and '{labelsingularcomposed}' for a user friendly name. The related request parameter is 'usetechnicalheaders' which can be true or false.
- the PrintParameters specifies whether to print parameters in the output and can be true or false. The associated request parameter is 'printparameters'.
- the ContentType specifies a deviating desired MIME content-type. The associated request parameter is 'contenttype'.
- the DispositionType specifies a deviating desired disposition type. The associated request parameter is 'dispositiontype'.
- the ContentFileName specifies a deviating desired file name and download as attachment. The associated request parameter is 'contentfilename'.
- the AccessControl is follows definition on all Invantive Web projects for access control, but specifically for the preset provided.
- the LogRequestProgress is a boolean value whether for the specific preset request logging is required.
- the connection name (ConnectionName) has the same meaning as the request parameter 'connection'.

Parameter Values

Values to bind to SQL parameters can be specified using ParameterValues. Parameter values specified in a preset overrule identically named request parameters. Parameter values consist of a list of parameters and their values, where each parameter has three elements:
• Name (**Name**) of the parameter.
• Data type (**DotnetDataType**) of the parameter.
• String representation (**Value**) of the parameter value.
• Whether for force the use of the parameter value specified or only use it as a default (**ForceValue**).

The following data types are available:
• bool
• byte
• ByteArray: to process files presented as POST parameters.
• char
• datetime
• datetimeoffset
• decimal
• double
• float
• guid
• int16
• int32
• int64
• uint16
• uint32
• uint64
• object
• sbyte
• string: texts.
• timespan
• null

1.7 XSL Transformation Parameters

The XSL transformation is executed using a number of pre-defined XSL parameters. These XSL parameters consist of all parameters provided to Data Access Point through the URL, plus the following.

The following values based upon the URL:
• DAPURIOriginalString: the original value.
- DAPURIAbsolutePath: the absolute path.
- DAPURITitle: the host name.
- DAPURIAPRILocalPath: the local path.
- DAPURIAPRRPathAndQuery: the path and query.
- DAPURIAPRP: the port number.
- DAPURIRUserQuery: the query.
- DAPURIAPRIScheme: the scheme.
- DAPURIAPRIServerInfo: the user information.

The following values based upon the current connected user:
- DAPURITitleCompanyID: the company ID.
- DAPURITitleCompanyName: the company name.
- DAPURITitleCompanyPhone: the company phone number.
- DAPURITitleCompanWebSite: the company web site.
- DAPURITitleEmailAddress: the email address.
- DAPURITitleFirstName: the first name.
- DAPURITitleFullName: the full name.
- DAPURITitleGender: the gender.
- DAPURITitleLanguage: the user interface language.
- DAPURITitleLastLogon: the last log on moment.
- DAPURITitleLastName: the last name.
- DAPURITitleLinkedIn: the LinkedIn profile.
- DAPURITitleLogOnCode: the log on code.
- DAPURITitleMiddleName: the middle name.
- DAPURITitleMobileNumber: the mobile phone number.
- DAPURITitleNationality: the nationality.
- DAPURITitlePhoneNumber: the phone number.
- DAPURITitleProfile: the picture (URL).
- DAPURITitleSkype: the Skype profile.
- DAPURITitleTitle: the title.
- DAPURITitleTwitter: the Twitter profile.
- DAPURITitleWebSite: the web site.

The following values based upon the current preset:
1.8 SQL Parameters

The SQL statements are provided with parameters. The parameters can be used using the syntax ':NAME'.

These parameters consist of all HTTP parameters provided through GET and/or POST, excluding the following which are reserved for use by Invantive Data Access Point itself:

- connection,
The list of parameter values is extended by values from the context in which Data Access Point runs.

The following parameter values are added based upon the URL:

- DAPURIOriginalString: the original value.
- DAPURIAbsolutePath: the absolute path.
- DAPURIHost: the host name.
- DAPURIAbsolutePath: the absolute path.
- DAPURIPort: the port number.
- DAPURIQuery: the query.
- DAPURIScheme: the scheme.
- DAPURIUserInfo: the user information.

The following values based upon the current connected user:

- DAPUserInfoCompanyId: the company ID.
- DAPUserInfoCompanyName: the company name.
- DAPUserInfoCompanyPhone: the company phone number.
- DAPUserInfoCompanyWebSite: the company web site.
- DAPUserInfoEmailAddress: the email address.
- DAPUserInfoFirstName: the first name.
- DAPUserInfoFullName: the full name.
- DAPUserInfoGender: the gender.
- DAPUserInfoLanguage: the user interface language.
- DAPUserInfoLastLogon: the last log on moment.
- DAPUserInfoLastName: the last name.
- DAPUserInfoLinkedIn: the LinkedIn profile.
- DAPUserInfoLogOnCode: the log on code.
- DAPUserInfoMiddleName: the middle name.
- DAPUserInfoMobileNumber: the mobile phone number.
- DAPUserInfoNationality: the nationality.
- DAPUserInfoPhoneNumber: the phone number.
- DAPUserInfoPictureUrl: the picture (URL).
- DAPUserInfoSkype: the Skype profile.
- DAPUserInfoTitle: the title.
- DAPUserInfoTwitter: the Twitter profile.
- DAPUserInfoWebSite: the web site.

The following parameter values are added based upon the current preset:
- DAPPresetFileName: the file name.
- DAPPresetAction: the action.
- DAPPresetCode: the code.
- DAPPresetConnectionName: the full name of the connection.
- DAPPresetContentType: the content type of the output.
- DAPPresetFormat: the format.
- DAPPresetSQLFile: the SQL file name.
- DAPPresetSQLStatement: the SQL statement.
- DAPPresetXSLLocation: the XSL file name.
- DAPPresetIncludeHeaders: whether to include headers in the output.
- DAPPresetHeaderFormat: the header format of the output.
- DAPPresetPrintParameters: whether to print parameters and their values in the output.

Plus the following parameter values:
- DAPSystemIPAddressDeviceExternal: the external IP address of the web server.
- DAPSystemIPAddressDeviceInternal: the internal IP address of the web server.
- DAPSystemIPAddressUserExternal: the external IP address of the current user.
- DAPSystemIPAddressUserInternal: the internal IP address of the current user.
- DAPShowConfidentialDetails: whether to include confidential details.
- DAPPrintParameters: whether to print and their values in the output.
- DAPIncludeHeaders: whether to include headers in the output.
- DAPUseTechnicalHeaders: whether to use technical headers in the output (column name) instead of user-friendly label.
- DAPSQLFile: the SQL file name.
- DAPXSLLocation: the XSL file name.
- DAPDeviatingConnectionName: the forced different full connection name.
- DAPDeviatingContentType: the forced different content type of the output.
- DAPDeviatingContentFileName: the forced different content file name of the output.

1.9 Folder Structure

The folder structure of Invantive Data Access Point has the following contents:
- root: some images and css that must be in root and Web.config.
- bin: executable code.
- images: images.
- App_Data: configuration folder.

App_Data Folder

The App_Data folder can have the following contents:
- Backup: previously used copies of the settings.xml database with defined databases.
- Cache: disk cache of HTTP requests.
- Config: detail configuration files.
- Log: folder in which copies are placed of received requests and their results on a high level.
- Templates: preferred folder with preset files, SQL and XSL files.
- Trace: folder in which the trace files are stored when tracing is configured.

Config Folder

The Config folder in the App_Data folder can have the following contents:
- application.xml: an Invantive web application configuration file with log and trace settings and Access Control Lists.
- invantive.lic: license file.
- settings*.xml: databases with defined databases.
1.10 Installation

To install Invantive Data Access Point perform the following steps:

- Make sure the server meets the requirements.
- Copy the msi file to the server which should run the web site.
- Run the installer and press 'Next':

![Installer Screenshot]

- Accept the default folder and press 'Next':
Wait for the installer to finish:

Close the installer by clicking on 'Finish':
Copy the files to the folder where the site should be hosted.

Add the folder to Microsoft IIS as a site.

1.11 Configuration

Security
Please make sure that the group IIS_IUSRS has write access to the following folders in the App_Data folder:

- Backup
- Cache
- Log

License
Please place the license file as invantive.lic in the App_Data/Config folder.

Configuration
Please create a file config.json in the App_Data/Config folder.

Databases
Please create a database settings file as settings*.xml in the App_Data/Config folder.
2 Invantive Basics

2.1 Configuration

2.1.1 Customer Service

All Invantive products exchanges messages with a central Customer Service node. These messages include:

- error messages for analysis,
- usage statistics for billing.

On Invantive-internal development workstations only, a non-standard Customer Service node can be selected by specifying a deviating URL in the environment variable INVANTIVE_CS_BASE_URL.

2.1.2 OS Platform

A variety of Invantive products is available on Windows, Linux and Mac OSX. The list of supported platforms varies per product, depending on the availability of the libraries such as Microsoft .NET Core.

The OS platform is automatically determined by Invantive software, but sometimes can raise bugs given the bleeding edge nature of Microsoft .NET Core. It is possible to overrule the automatic detection of the OS platform by assigning a value to the environment variable INVANTIVE_FORCED_OS. The following values are supported:

- windows: Microsoft Windows,
- linux: Linux,
- osx: Mac OSX.

2.1.3 Startup Checks

The Invantive products execute a number of checks at application start to ensure that the environment running the software meets a number of pre-conditions as established by Invantive. These checks can be disabled for analysis purposes and out-of-the-ordinary deployment scenarios.

Support on products is only available when checks are not manually configured.

The following environment variables allow manual configuration of the checks by setting them to 'true' or 'false':

- INVANTIVE_CHECK_SYSTEM_COMPATIBILITY: validate system compatibility.
- INVANTIVE_MAINTAIN_VSTO: re-activate Invantive VSTO add-ins when disabled.
- INVANTIVE_CHECK_OS_UPDATES: validate OS updates have been applied sufficiently recent.

Configuration of checks is solely available on the Windows OS platform.

2.1.4 Cryptography

The Invantive products use cryptographic operations to protect:

- License key
- Invantive Keychain
By default, a key pair is used and stored in the profile of the user for encryption and decryption.

**Windows**

On Windows, the encryption is normally done using Windows-managed encryption protocols. The key elements are stored in the roaming profile of the current user.

In some deployment scenarios, a user has only a temporary Windows profile. In that case it is not possible to store a key pair. This is typically signaled by an itgenlic510 error code.

As an alternative, you can configure the environment variable `INVANTIVE_CRYPTOGRAPHY` to the value "MACHINE" to use a key pair that is stored solely on the device.

By setting the environment variable `INVANTIVE_RSA` to `INVANTIVE`, encryption on Windows is also managed as on other platforms by custom Invantive code at the expense of loss of some security features. Often Windows patches break the functionality of previously Windows-managed encryption keys, typically signaled by an error like "Key not valid for use in specified state". Switching to custom Invantive code will solve this problem.

**Linux, Mac OSX, Android, iPhone, Windows on Parallels**

On all other platforms, Invantive offers solely encryption using key elements stored in files in the RSA folder.

### 2.1.5 UI Language

The Invantive products supported approximately ten languages. On first startup, the language of the Windows version will be used when supported. Otherwise US-English is used.

The license decides which from the languages are supported.

Additionally, the user interface language chosen can further be restricted by setting the environment variable `INVANTIVE_ALLOWED_LANGUAGE_CODES` to a comma-separated list of two characters ISO 639-1 codes.

### 2.1.6 Folders

The Invantive products store configuration and runtime information in a folder hierarchy. This hierarchy is located within the Invantive folder of the user profile. It can be opened in Windows Explorer by entering `%USERPROFILE%\Invantive` in the location bar.

The location of the folder hierarchy can be changed using environment variables. The central location can be changed by setting the environment variable `INVANTIVE_CONFIGURATION_FOLDER` to a different folder.

A number of subfolders can be relocated too:

- `INVANTIVE_CONFIGURATION_BACKUP_FOLDER`: the folder with backups of settings files. Defaults to the master folder plus "Backup".

- `INVANTIVE_CONFIGURATION_CACHE_FOLDER`: the folder with disk cache files. Defaults to the master folder plus "Cache".

- `INVANTIVE_CONFIGURATION_HTTP_CACHE_FOLDER`: the folder with HTTP disk cache files. Defaults to the root cache folder plus "http" and the OS-user and front-end user.
- **INVANTIVE\_CONFIGURATION\_DATA\_CACHE\_CACHE\_FOLDER**: the folder with Data Cache disk cache files. Defaults to the root cache folder plus "datacache". Disk cache files improve performance of HTTP downloads, but when necessary can be purged.

- **INVANTIVE\_CONFIGURATION\_LOG\_FOLDER**: the folder with log files. Defaults to the master folder plus "Log".

- **INVANTIVE\_CONFIGURATION\_DATABASES\_FOLDER**: the folder with databases files. Defaults to the master folder.

- **INVANTIVE\_CONFIGURATION\_PLUGINS\_FOLDER**: the folder with plugin files. Defaults to the master folder plus "Plugins".

- **INVANTIVE\_CONFIGURATION\_PROVIDERS\_FOLDER**: the folder with provider files. Defaults to the master folder plus "Providers".

- **INVANTIVE\_CONFIGURATION\_RSA\_FOLDER**: the folder with RSA configuration files. Defaults to the master folder plus "RSA".

- **INVANTIVE\_CONFIGURATION\_TEMPLATES\_FOLDER**: the folder with template files. Defaults to the master folder plus "Templates".

- **INVANTIVE\_CONFIGURATION\_TRACE\_FOLDER**: the folder with trace files. Defaults to the master folder plus "Trace".

The values may contain any combination of the following placeholders which will be expanded:

- **iid**: Invantive Installation ID.
- **sessionid**: Invantive session ID.
- **frontenduser**: name of front-end user (when available).
- **osuser**: name of operating system user.

A folder can be configured for custom translations which overrule all default translations using the environment variable **INVANTIVE\_I18N\_FOLDER**.

### 3 Invantive SQL

One of the most familiar questions at our support desk is "what functions are available" in Invantive SQL to query data in Exact Online.

This second-generation SQL parser is an extensive implementation of many commonly found SQL constructs from the ANSI SQL standard.

It includes in addition to the features of the first-generation SQL parser also:

- **joins**,
- **outer joins**,
- **cross joins**,
- **group functions such as stddev, avg and listagg**,
- **value functions such as xmlescape and round**.
There are two flavors shipped:

- Free version: second-generation SQL parser without joins and some upcoming non-ANSI standard advanced mapping functions for large volume financial analysis and reporting.
- Paid version: identical to the free version but with joins and advanced mapping functions.

The EBNF-grammar in Grammar depicts the possibilities.

### 3.1 Language

#### 3.1.1 Compatibility

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped with Invantive-specific extensions, especially for procedural SQL, distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few. The same holds for the procedural extension Invantive Procedural SQL, which reflects SQL/PSM and makes it easy to port Oracle PL/SQL or PostgreSQL PL/pgSQL statements.

#### 3.1.2 Distributed SQL, Databases and Data Containers

It is easy to exchange and/or combine data across the supported platforms with data. To each platform (such as Salesforce or Exact Online Belgium) multiple connections can be active with the same or different platform-specific connection settings. Each open connection to a platform is named a 'data container'.

All opened connections together are named a 'database'.

When multiple data containers have been opened, each one has an alias to refer it by in Invantive SQL statements. For instance, a connection can be open for two different customer accounts on Exact Online Netherlands aliased as 'eolnl_comp1' and 'eolnl_comp55') and one for an Exact Online Belgium custom, aliased as 'eolbe_my_new_company'. The aliases can be freely chosen as long as they are valid identifiers and defined in the databases configuration file 'settings.xml'.

#### 3.1.3 Service Providers

A number of special connections are always made, each of which can occur at most once. These are the 'service providers' such as:

- 'datadictionary': metadata of the current database, such as list of tables and executed SQL statements performance.
- 'os': information on the operating system running the SQL engine, such as reading file contents.
- 'smtp': synchronously send mails through SMTP.

#### 3.1.4 Partitioning

Especially online platforms have a multi-tenant structure, in which the data is partitioned per customer, company or person. When the data model is identical across tenants, Invantive SQL considers them 'partitions'. SQL statements can run across multiple or one partitions, often in parallel. This enables consolidation scenarios across partitions (such as Exact Online or Nmbrs companies) as well as high-performance in MPP environments.
The partitions to be used can be specified with the 'use' statement, either through an explicit list of partitions to be selected across data containers, or through a SQL select statement returning the list of partitions to use. Please note that although the 'use' statement resembles the 'use DATABASE' statement on Microsoft SQL Server or PostgreSQL you can on Invantive SQL have multiple partitions active at the same time in one user session.

3.1.5 Identifiers

For identifiers, the regular conventions hold for the set of allowed characters. Depending on the platform, the identifiers are case sensitive or not. In general, it is best to assume that the identifier are case insensitive. There is no length limit on an identifier imposed by Invantive SQL.

3.1.6 Procedural SQL

Invantive Procedural SQL (or "PSQL" for short) is a procedural extension on top of Invantive SQL. It is based on the ISO-standard 9075-4:2016 (SQL/PSM) and extends Invantive SQL with procedural options like blocks, variables, conditional execution and loops. The procedural code is - together with the Invantive SQL contained - as a whole into pseudo-code and then executed.

The procedural code does not lean on the procedural options of the platforms being used, so it is easy to retrieve and change data in all supported cloud, file and database platforms. The pre-compiled procedural code does not perform context switches between procedural and SQL logic.

3.1.7 Licensing

The available functionality of Invantive SQL features is based upon the license features. For instance the free implementation of Invantive SQL is limited to 1.000 rows and no access to group functions. Please consult the data dictionary contents for your license features.

3.1.8 Settings.xml

The file settings.xml defines for a user or program the list of defined databases. Databases are grouped in 'database groups' for visual display. Database groups have no further functionality. Each database consists of one or multiple data containers.

The file 'settings.xml' is most often found on Microsoft Windows in your '%USERPROFILE%\invantive' folder, such as 'c:\users\john.doe\invantive\settings.xml'. It is shared across all Invantive SQL product installations for the user.

There are many scenarios to share database specifications across a user community, such as WAN-scenarios with Invantive Web Service, large corporate scenarios using DNS-entries as well as file shares, included files as well as single user solutions. Please involve a consultant when you want to deploy across thousands of users or more.

For user communities of up to 10 users, we recommend that company-specific settings are grouped per role in a separate file named 'settings-ROLE.xml' and placed in the default folder. Invantive SQL will automatically merge these files in the main settings.xml file.

3.1.9 Group Functions

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped with Invantive-specific extensions, especially for distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few.
Popular group functions such as 'stddev' are available. However, currently you can not combine in one unnested SQL statement both group functions as well as expressions on the variables. In that case use an inner (nested) SQL statement to apply the expressions on the data, and execute the group functions in the outer SQL statement with the syntax 'select group() from ( select ... from ... )'.

### 3.1.10 Locking

An Invantive SQL statement can work with many traditional and online platforms. There are no locking features on data and objects, since few online and traditional platforms connected provide these and the typical use of distributed transactions leave even less opportunity for data and object locking.

### 3.1.11 Transactions

Invantive SQL has limited support for transactions. DML is forwarded to a platform and depending on the platform an error can cause part of the work to be registered or everything to be rolled back. Within the SQL engine, multiple changes can be collected and forwarded to the platform at once. For instance, when creating an EDIFACT message you need to combine an invoice header with invoice lines into one EDIFACT message. Collection of multiple changes is done using the 'identified by' and 'attach to' syntax, optionally preceded by 'begin transaction'.

### 3.1.12 Grammar

**sqlBatch:**

```plaintext
sqlOrPSqlStatement BATCHSEPARATOR BATCHSEPARATOR sqlBatch

sqlBatch ::= sqlOrPSqlStatement ( BATCHSEPARATOR sqlOrPSqlStatement ) * BATCHSEPARATOR
```

no references

**sqlOrPSqlStatement:**

```plaintext
sqlStatement pSqlStatement

sqlOrPSqlStatement ::= sqlStatement | pSqlStatement
```

referenced by:
- `sqlBatch`

**sqlStatement:**

An Invantive SQL can retrieve data from many traditional and online platforms. Many platforms also support the use of DML (Data Manipulation Language) statements to change the data contained. On a few platforms you can execute DDL (Data Definition Language) statements to create new data structure or objects such as tables, procedures or sequences.

```plaintext
selectStatement insertStatement updateStatement deleteStatement ddlStatement useStatement transactionStatement executeFileStatement
```
sqlStatement ::= selectStatement | insertStatement | updateStatement | deleteStatement | ddlStatement | setState | useStatement | transactionStatement | executeFileStatement

referenced by:
- pSqlStatement
- sqlOrPSqlStatement

selectStatement:
A SQL select statement retrieves data from one or multiple data containers. A select statement can be composed of multiple data sets retrieved from many platforms, combined by set operators such as 'union'.

Often the performance of cloud platforms is less than traditional database platforms. With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'. An alternative for a 'limit' clause is to use the 'top' clause.

A sequence of Invantive SQL statements, separated by the semi-colon separator character.

Each statement in the SQL batch will be executed consecutively. Execution will be stopped when an error occurs during execution of a statement.

uniqueSelectStatement setOperatorSelectStatement orderBy limitClause
selectStatement ::= uniqueSelectStatement setOperatorSelectStatement orderBy limitClause

- pSqlForRecordLoopStatement
- sqlStatement
- useStatement

inSelectStatement:
A SQL select statement retrieves data from one or multiple data containers. This variant makes this data available to a containing SQL select statement. This feature is also known as an 'inline view'.

selectStatement
SQL is based upon a solid mathematical foundation named 'set theory' with some exceptions. The set operators of Invantive SQL enable you to combine sets of data sets such as merging two sets of data. Please note that SQL actually uses 'bags', which opposed to 'sets', allow duplicates. To change bags of data into sets, either use 'distinct' or the 'union' set operator without 'all'. In general, the extensive use of 'distinct' signals bad database design.

The 'union' set operator returns the union of the data on the left and right side of the union while removing duplicate rows. The 'union all' set operator returns the union of the data on the left and right side of the union without removing duplicate rows. The 'minus' set operator returns all rows from the left side which do not occur in the right side. The 'intersect' set operator returns all rows that occur both in the left and right side.

SELECT...INTO

select executionHints distinct topClause selectList INTO variableList FROM dataSource

SELECT...FROM...WHERE...GROUP BY

DATA SOURCE:

A data source can be a table, a table with parameters or a nested select (an 'inline view').
select:

SELECT

executionHints:

Execution hints allow you to control individually the execution of SQL statements. Whenever possible, the hints will be used. In contrary to other platforms, Invantive SQL requires a hint to be valid according to the grammar when specified. This reduces the engineering risk that hints become invalid by accident.

EXECUTION_HINT_START joinSet noJoinSet ods resultSetName lowCost httpDiskCache httpMemoryCache EXECUTION_HINT_END

httpDiskCache:

The http_disk_cache-hint specifies whether messages may be cached on disk when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the disk cache, the second parameter is a boolean whether data retrieved must be stored also in the disk cache and the third parameter is an integer that specifies the number of seconds before a disk cache hit found is to considered stale.

The use of the http_disk-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents of the disk cache are persistent across Invantive SQL sessions.

The disk cache is located in the Cache folder of the Invantive configuration folder.

HTTP_DISK_CACHE PARENTHESES_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESES_CLOSE

httpDiskCache

referenced by:

- uniqueSelectStatement
httpMemoryCache:
The http_memory_cache-hint specifies whether messages may be cached in memory when
the provider uses HTTP to exchange data with the backing platform. This typically holds only
for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default set-
ing is false. The first parameter is a boolean whether data may be taken from the memory
cache, the second parameter is a boolean whether data retrieved must be stored also in the
memory cache and the third parameter is an integer that specifies the number of seconds
before a memory cache hit found is to considered stale.

The use of the http_memory-cache-hint is recommended for data which is known to change
seldom such as seeded or reference data. The contents in the memory cache are forgotten
across Invantive SQL sessions.

The memory cache is located in the Cache folder of the Invantive configuration folder.

HTTP_MEMORY_CACHE PARENTHESIS_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESIS_CLOSE

ods:
The ods-hint controls the use of the Invantive Data Cache stored in a relational database.
The Invantive Data Cache is also the basis of the Operational Data Store managed by In-
vantive Data Replicator and the data warehouses managed by Invantive Data Vault. The ods-
hint specifies the maximum age data from the data cache eligible for use.

The boolean specifies whether the Data Cache may be used to answer a query. Set it to
false to disable use of Data Cache for the duration of the query. Keep it on the default true to
use Data Cache.

The interval specifies the period of time during which cached results are considered suffi-
ciently fresh for use, such as '30 minutes'.

When no interval is present, the actual platform is consulted. The default with Invantive Data
Cache enabled is to always use the data cache contents when not stale according to the
metadata of the data cache. In general, that defaults to a maximum age of 7 days.

resultSetName \[26\] ::= RESULT_SET_NAME \[27\] ( PARENTHESES_OPEN \[27\] stringConstant \[27\] PARENTHESES_CLOSE \[27\] )?

referenced by:
  • executionHints \[24\]

joinSet:
Control join approach between two data sources. A column-indexed lookup will be used instead of a full table scan when the number of rows on the left-hand side does not exceed the maximum number of rows specified in the hint. When not specified, a hash lookup will only be used when the number of rows on the left-side does not exceed 5,000.

The actual implementation of a hash lookup depends on the platform on which the data container runs. For instance with OData, a number of requests will be made using an in-construct with a limited number of in-values. With a relation database platform, a native SQL 'in' will be used.

The first identifier is the alias of the table on the right-hand side of the join. The second identifier is the name of the column used to join upon in the right-hand side. The numeric constant specifies upto what number of rows on the left-hand side of the join will allow the join set hint to be used. When the number of rows exceeds the numeric constant, a full table join is made.

The following example takes for instances 5,000 sales invoices from an Exact Online environment with 100,000 sales invoices. Each sales invoice has 4..10 lines. The join does not retrieve all sales invoices nor all invoice lines, but instead fetches the 5,000 sales invoices using the where-clause, and then retrieves the related invoice lines using a column-indexed lookup by invoiceid. Since Exact Online is an OData source, the approximately 30,000 invoice lines will be retrieves in 300 session I/Os each having an in-construct for 100 lines on invoiceid.

select /*+ join_set(sil, invoiceid, 10000) */ * from ExactOnlineREST..SalesInvoices sik join ExactOnlineREST..SalesInvoiceLines sil on sil.invoiceid = sik.invoiceid where sik.status = 50 and sik.InvoiceDate between to_date( :P_RECEIPT_DATE_FROM , 'yyyymmdd') and to_date( :P_RECEIPT_DATE_TO, 'yyyymmdd')

noJoinSet ::= NO_JOIN_SET PARENTHESIS_OPEN identifier ( COMMA identifier )? PARENTHESIS_CLOSE

variableList:
variableName COMMA variableName
variableList ::= variableName ( COMMA variableName )?

distinct:
Addition of the 'distinct' keyword to a SQL select statement de-duplicates the rows returned. Rows are considered duplicates when the values in all selected columns are identical, with two null-values considered equal.

lowCost:
The low_cost-hint specifies that the select with the hint must be considered a select with low execution costs. Low execution costs trigger early evaluation during parsing. By default, select statements using solely in memory storage, dummy and data dictionary are considered low cost and evaluated early. The evaluation of all others is delayed as long as possible.

The use of the low_cost-hint is recommended when the select is used with a 'in ( select ... )' syntax and the developer knows beforehand that it will evaluate fast to values and that the use of these values will allow the use of server-side filtering for the outer select.

topClause:
With the 'top' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'.

TOP numericConstant
topClause::= TOP numericConstant

limitClause:
With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'.

LIMIT numericConstant

limitClause::= LIMIT numericConstant

referenced by:
- selectStatement

embeddedSelect:
An embedded select, also known as an 'inline view', retrieves rows using the specified select statement. These rows are consumed by the outer select as were it the results of retrieving the rows from a table.

Invantive SQL does not allow grouping rows with expressions as columns. An embedded select is typically used to evaluate expressions to rows with solely constants. After applying the embedded select the group operators can be applied.

- `updateStatement` 53

`tableOrFunctionSpec`:

A table specification requiring a comma-separated list of parameters to determine the rows to be retrieved.

Traditional SQL syntax did not provide for parameterized queries, matching set theory. Modern variants such as pipelined table functions allow a stored procedure or other imperative language-based approaches to generate rows based upon parameter values. Many data containers support queries that returns rows based upon parameter values. This holds especially for SOAP web services. Table specifications with parameters ease queries on such data containers.

The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

joinStatements ::= joinStatement+

referenced by:
- uniqueSelectStatement

joinStatement:

A join statement combines two result sets. Only combinations of rows taken from both result sets are returned when they meet the join conditions.

joinCategory join dataSource joinConditions

joinStatement ::= joinCategory join dataSource joinConditions

referenced by:
- joinStatements

joinCategory:

The join category specifies what combinations of rows are considered. The following variants can be used:

- inner join, as indicated by 'join' or 'inner join': an inner join returns all combinations of rows from both result sets that meet the join conditions.
- left outer, as indicated by 'left outer join': a left outer join returns the same rows as an inner join, extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- right outer, as indicated by 'right outer join': a right outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. Each column that originates from the left result set is assigned a null value.
- full outer, as indicated by 'full outer join': a full outer join returns the same rows as an inner join, extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the left result set is assigned a null value. The results are also extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- cross join, as indicated by 'cross join': a cross join returns a Cartesian product of the rows from both result sets. A 'Cartesian product' is a term from set theory, which indicates that all combinations are returned.

ddlStatement:
ddlStatement ::= createTableStatement | dropTableStatement | alterPersistentCacheStatement

referenced by:

- sqlStatement

alterPersistentCacheStatement:

Besides an in-memory cache valid during the duration of a session, Invantive SQL offers an integrated cache storing data persistently using an on-premise or cloud relation database such as SQL Server or PostgreSQL. When configured, Invantive SQL first tries to find sufficiently fresh data in the cache. This reduces the number of data loads from slow data containers such as some cloud platforms. In general, the performance increase when the rows can be fully retrieved from a cache is between a factor 25 and 2.500.

Invantive SQL itself manages the table structure and table contents in the relation database used as a data cache. On initial use just provide an empty database. Invantive SQL installs a repository consisting of a few tables. The repository tables have names starting with 'dc_'.

For each table partition version, a so-called facts table is created. A facts table contains a full copy of the rows retrieved from the data container. Facts tables have names starting with 'dcd_', followed by a unique hash signaling the table partition version. When necessary, additional database objects are maintained such as indexes to improve performance. As with facts table names, all column names are also hashed based upon an algorithm including the original column name. These facts tables are not intended for direct use using native SQL.

Each facts table has a unique state from the following state, with Ready state signaling the now current version:

- Initializing ('I'): the facts table will be created.
- View creation ('V'): logical views will be created.
- Prepared ('P'): the facts table has been created, but contains yet no rows.
- Seeding ('S'): the facts table is being seeded with the contents of the previously current version.
- Loading ('L'): loading new facts from data container using watershed or another algorithm.
- Ready ('R'): the facts table is available and the current one to be used.
- Obsoleted ('O'): the facts table still exists, but the data has passed it's conservation period. Often a newer version is now current.
- Dropped ('D'): the facts table now longer exist, but the metadata is still present in the repository tables.

The persistent cache in the database can be used with native SQL when extended by Invantive Data Replicator. Invantive Data Replicator can create and maintain a database view (a so-called 'partition view') for the now current version of table partition. Similarly, it can create an 'overall view', showing the rows across all partitions of the now current versions per partition.

The overall views are typically used for consolidation purposes, bringing together data across multiple companies or persons.

beginTransactionStatement:

A begin transaction statement initiates a transaction. Invantive SQL typically provides no transaction logic given the distributed nature and the limitations of the possible platforms. Some platforms enable collection of transaction data, which are to be handed over to the backing platform all together.

BEGIN TRANSACTION
   beginTransactionStatement
::= BEGIN TRANSACTION?

   • transactionStatement

commitTransactionStatement:

Hand over all collected transaction to the backing platform for registration.

COMMIT TRANSACTION
   commitTransactionStatement
::= COMMIT TRANSACTION?

referenced by:
   • transactionStatement

useStatement:

The use statement enables you to specify which partitions should be accessed by subsequent select, insert, update and delete statements. You can specify one or multiple partitions as a comma-separated list, possibly for a specific data container by appending an at-sign plus data container alias to the partition code. The value 'default' has a special meaning; it specifies to use the partition(s) originally selected when you logged on. The value 'all' also has a special meaning: it selects all partitions available.

For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use 35@eolnl, 57345@nmbrsnl'.

For complex scenarios, you can specify any valid Invantive SQL select statement which returns one or two columns. Each row from the query specifies one partition to select. The first column specifies the partition code, whereas the optional second column specifies a specific data container alias.
For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use select '35', 'eolnl' from dual@datadictionary union all select '57345', 'nmbrsnl' from dual@datadictionary'.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
abs:
Returns the absolute value of a double-precision floating-point number.
Parameters:
- Input: A number that is greater than or equal to System.Double.MinValue, but less than or equal to System.Double.MaxValue.
Returns: A double-precision floating-point number. ABS

\[
\text{abs} \quad : = \quad \text{ABS}
\]

 acos:
Returns the angle of the provided cosine.
Parameters:
- Input: the cosine to get the angle of.
Returns: A number which represents the angle of the provided cosine. ACOS

\[
\text{acos} \quad : = \quad \text{ACOS}
\]

anonymize:
Anonymize a text or number. Anonymization is executed such that when the same original value is anonymized within the same session, the anonymized value will be identical. The anonymized value also uniquely matches the original value. With no access to the anonymization map however, the original value can however not be calculated from the anonymized value.

In mathematics, the anonymization function is a bijection: each element of the original set is paired with exactly one element of the anonymized set, and each element of the anonymized set is paired with exactly one element of the original set.
Parameters:
- Value: A text or number to be obfuscated.
- Maximum length (optional): Maximum length in digits for numbers or characters for text of anonymized value. Null means no restriction on maximum length.
- Mapping (optional): algorithm to use. The default algorithm is 'DEFAULT' which maps text values to a range of hexadecimal characters and numbers to a range of numbers. Alternative mappings are described below.

The following anonymization maps are available on installation:
- DEFAULT: the default algorithm.
- IVE-GL-JOURNAL-DESCRIPTION: general ledger journal descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
• IVE-GL-ACCOUNT-DESCRIPTION: general ledger account descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
• IVE-PSN-FIRST-NAME: person first names: prefer readable alternative first names, anonymize all.
• IVE-PSN-LAST-NAME: person last names: prefer readable alternative last names, anonymize all.
• IVE-ADS-CITY-NAME: address city names: prefer readable alternative city names, anonymize all.
• IVE-ADS-STREET-NAME: address street names: prefer readable alternative street names, anonymize all.

The data dictionary contains the anonymization maps used so far in the session and their corresponding values:

```sql
select * from SystemAnonymizationMaps@DataDictionary
select * from SystemAnonymizationMapValues@DataDictionary
select * from SystemAnonymizationPredefinedMaps@DataDictionary
```

Returns: Anonymized value. ANONYMIZE

```plaintext
anonymize ::= ANONYMIZE
```

Referenced by:
- `functionExpression`

`ascii`:

Get the position of a character on database character set.

Parameters:
- Input: character to get position from.

Returns: The position of the character on database character set. ASCII

```plaintext
ascii ::= ASCII
```

Referenced by:
- `functionExpression`

`asin`:

Returns the angle of the provided sine.

Parameters:
- Input: the sine to get the angle of.

Returns: A number which represents the angle of the provided sine. ASIN

```plaintext
asin ::= ASIN
```

Referenced by:
- `functionExpression`

`atan`:

Returns the angle of the provided tangent.
Parameters:
  - Input: the tangent to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN
  \( \text{atan} \) ::= \( \text{ATAN} \)

referenced by:
  - functionExpression

atan2:

Returns the angle of the provided tangent.

Parameters:
  - First number: the first number to get the angle of.
  - Second number: the second to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN2
  \( \text{atan2} \) ::= \( \text{ATAN2} \)

referenced by:
  - functionExpression

add_months:

Add an amount of months to a datetime.

Parameters:
  - Date: datetime to add the months to.
  - Months: the amount of months to add.

Returns: A new datetime with the amount of months added. ADD_MONTHS
  \( \text{add\_months} \) ::= \( \text{ADD\_MONTHS} \)

referenced by:
  - functionExpression

base64_decode:

Converts the base64_encoded value back to the binary value as defined on Wikipedia.

Parameters:
  - Input: value to convert back to the original.

Returns: The input decoded back to the binary value. BASE64_DECODE
  \( \text{base64\_decode} \) ::= \( \text{BASE64\_DECODE} \)

referenced by:
  - functionExpression

base64_encode:
Converts a binary value to base64-encoded characters as defined on Wikipedia.

Parameters:
  - Input: value to convert to base64 characters.

Returns: The input encoded to base64 characters. BASE64_ENCODE

```
base64_encode : = BASE64_ENCODE
```

referred by:
  - `functionExpression`[62]

camel:

Converts provided string to Camel case.

Parameters:
  - Input: the string that will be converted to Camel case.

Returns: A string converted to Camel case. CAMEL

```
camel : = CAMEL
```

referred by:
  - `functionExpression`[62]

ceil:

Rounds the input to the largest following integer. Unless an amount of decimals is defined, in which case it rounds to the largest integer number with the amount of decimals or date with the amount of positions.

Parameters:
  - Input: A number or datetime to ceil.
  - Decimals [optional]: A number to specify how many decimals it may ceil to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The ceiling of the input. CEIL

```
ceil : = CEIL
```

referred by:
  - `functionExpression`[62]

chr:

Get a character from database character set.

Parameters:
  - Input: a numeric value of a character.

Returns: A character from the database character set. CHR CHAR

```
char : = CHR | CHAR
```

referred by:
• functionExpression

bit_length:
Get the number of bits needed to represent a value. For a blob, this is the number of bits for
the bytes of the blob. For all other data types, the value is first converted to a string and then
the number of bits of the UTF8 representation is determined.
Parameters:
  • Value: value to determine length in bits for.
Returns: number of bits needed to represent the value. BIT_LENGTH
  
  bit_length ::= BIT_LENGTH

referenced by:
• functionExpression

octet_length:
Get the number of bytes needed to represent a value. For a blob, this is the number of bytes
of the blob. For all other data types, the value is first converted to a string and then the num-
ber of bytes of the UTF8 representation is determined.
Parameters:
  • Value: value to determine length in bytes for.
Returns: number of bytes needed to represent the value. OCTET_LENGTH
  
  octet_length ::= OCTET_LENGTH

referenced by:
• functionExpression

repeat:
Get a concatenation of the text by a number of times.
Parameters:
  • Text: text to repeat.
  • Times: number of time to repeat the text.
Returns: the text repeated a number of times. REPEAT
  
  repeat ::= REPEAT

referenced by:
• functionExpression

raise_error:
RAISE_ERROR
  
  raise_error ::= RAISE_ERROR

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
coalesce:
Performs a coalescing operation.
Parameters:
- Left: an object.
- Right: an object.
Returns: the left value if right is empty, otherwise the right value. COALESCE  
\[
\text{coalesce} \ ::= \text{COALESCE} 
\]

concat:
Concatenate the left and right values together as a text.

\[
\text{concat} \ ::= \text{CONCAT_OP} 
\]

concat_func:
Concatenate a list of values together as a text.

\[
\text{concat_func} \ ::= \text{CONCAT} 
\]

cos:
Returns the cosine of the provided angle.
Parameters:
- Input: the angle to get the cosine of.
Returns: A number which represents the cosine of the provided angle. COS  
\[
\text{cos} \ ::= \text{COS} 
\]
COVFEFIFY

    covfefify ::= COVFEFIFY

referenced by:

    - functionExpression

compress:

COMPRESS

    compress ::= COMPRESS

dateadd:

Adds an amount of time to a date.

Parameters:

    - Interval: the date interval to be added.
    - Number: the number of intervals to add.
    - Date: the date to which the interval should be added.

Returns: The original date with the number of intervals added. DATEADD

    dateadd ::= DATEADD

referenced by:

    - functionExpression

datepart:

Get the specified datepart from a datetime.

Parameters:

    - datepart: a part of a date.
    - date: a datetime to get the datepart from.

Returns: a part of a datetime. DATEPART

    datepart ::= DATEPART

referenced by:

    - functionExpression
date ceil:
DATE_CEIL
date ceil :: DATE_CEIL

day:
Collect the day from a date.
Parameters:
  • Input: A date Time.
Returns: The day as an integer. DAY
day :: DAY
referenced by:
  • functionExpression

dayofweek:
Collect the day of a week from a date.

Parameters:
- Input: A dateTime.

Returns: The day of a week as an integer. DAYOFWEEK

\[
\text{dayofweek} ::= \text{DAYOFWEEK}
\]

referenced by:
- functionExpression

\section*{dayofyear:}

Collect the day of a year from a date.

Parameters:
- Input: A dateTime.

Returns: The day of a year as an integer. DAYOFYEAR

\[
\text{dayofyear} ::= \text{DAYOFYEAR}
\]

referenced by:
- functionExpression

\section*{dense_rank:}

DENSE_RANK

\[
\text{dense_rank} ::= \text{DENSE_RANK}
\]

DOUBLE_METAPHONE_ALT

\[
\text{double_metaphone_alt} ::= \text{DOUBLE_METAPHONE_ALT}
\]

referenced by:
- functionExpression
divide:
Divide one number by the second number.

Parameters:
• first: a number to divide.
• second: a number to divide with.

Returns: the divided output. DIVIDE

\[
\text{divide} \quad ::= \quad \text{DIVIDE}
\]

exp:
Returns the provided number raised to the specified power.

Parameters:
• Input: the number to raise by the specified power.

Returns: A number which is the provided number raised to the specified power. EXP_OP

\[
\text{exp} \quad ::= \quad \text{EXP_OP}
\]

floor:
Rounds the input to the smallest following integer. Unless an amount of decimals is defined, in which case it rounds to the smallest integer with the amount of decimals or date with the amount of positions.

Parameters:
• Input: A number or datetime to floor.
• Decimals [optional]: A number to specify how many decimals it may floor to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The floor of the input. FLOOR

\[
\text{floor} \quad ::= \quad \text{FLOOR}
\]

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
from_unixtime:
Get the date/time from an integer representing a UNIX epoch time.

Parameters:
- Input: An integer.

Returns: The date/time which the UNIX epoch time represents.

```sql
FROM_UNIXTIME
::= FROM_UNIXTIME
```

hour:
Collect the hour from a date.

Parameters:
- Input: A dateTime.

Returns: The hour as an integer.

```sql
HOUR
::= HOUR
```

initcap:
Changes the first letter of each word in uppercase, all other letters in lowercase.

Parameters:
- Input: Text to convert.

Returns: The input with the first letter of each word in uppercase.

```sql
INITCAP
::= INITCAP
```

instr:
Get a number which is a position of the first occurrence of substring in the string.

Parameters:
- String: String to be searched.
- Substring: Text to search for.
- StartPosition [optional]: Position of string to start searching.
- occurrence [optional]: Return the position of the occurrence.

Returns: The position of the substring inside the original string.

```sql
INSTR
::= INSTR
```
jsondecode:

\[
\text{JSONDECODE} \ \\
\text{jsondecode} = \text{JSONDECODE}

In:
Get the natural logarithm of a number.

Parameters:
- Input: a number to get the natural logarithm from.

Returns: The natural logarithm of the input. LN

\[ \text{\texttt{ln}} \quad \text{:=} \quad \text{LN} \]

 referenced by:
- functionExpression

log:
Get the natural logarithm of a number in a specified base.

Parameters:
- Input: a number to get the natural logarithm from.
- Base [optional]: the base to get the natural logarithm from.

Returns: The natural logarithm of the input in the specified base. LOG

\[ \text{\texttt{log}} \quad \text{:=} \quad \text{LOG} \]

 referenced by:
- functionExpression

lower:
Converts provided string to lowercase.

Parameters:
- Input: the string that will be converted to lowercase.

Returns: A string converted to lowercase. LOWER

\[ \text{\texttt{lower}} \quad \text{:=} \quad \text{LOWER} \]

 referenced by:
- functionExpression

lpad:
Pad a string to the left to make it a specified length.

Parameters:
- Input: string to be padded.
- Length: the length the string should be padded to.
- Characters [optional]: Characters to pad with.

Returns: A string padded to the left to a given length with the optional specified characters. LPAD

\[ \text{\texttt{lpad}} \quad \text{:=} \quad \text{LPAD} \]

 referenced by:
- functionExpression
**ltrim:**

Trims characters from the left side of a string.

**Parameters:**
- Input: the string from to trim characters from the left side.
- (Optional) Chars to trim: the character to trim. Default is "."

Returns: A string with chars trimmed from the left. LTRIM

```plaintext
ltrim    ::= LTRIM
```

**md5:**

Converts a value to a 128-bit hash value as defined on [Wikipedia](https://en.wikipedia.org/wiki/MD5).

**Parameters:**
- Input: Text to convert with MD5.

Returns: The input converted with MD5. MD5

```plaintext
md5    ::= MD5
```

**metaphone:**

Converts a value to the Metaphone code as defined on [Wikipedia](https://en.wikipedia.org/wiki/Metaphone).

**Parameters:**
- Input: value to convert to metaphone.
- Length: maximum output length of the given input.

Returns: The input converted to metaphone, with a given output length. METAPHONE

```plaintext
metaphone    ::= METAPHONE
```

**metaphone3:**

METAPHONE3

```plaintext
metaphone3    ::= METAPHONE3
```
metaphone3_alt:

METAPHONE3_ALT

metaphone3_alt[

minus:

Subtracts a value from another.

Parameters:

• Value: a number or datetime.
• Subtract: a number or datetime.

Returns: The value minus the subtraction. MINUS

minus[
77
] ::= MINUS[
77
]

referenced by:

• arithmeticExpression[
61
]

minute:

Collect the minute from a date.

Parameters:

• Input: A dateTime.

Returns: The minute as an integer. MINUTE

minute[
77
] ::= MINUTE[
77
]

referenced by:

• functionExpression[
62
]

month:

Collect the month from a date.
Parameters:
- Input: A dateTime.

Returns: The month as an integer, MONTH

\[ \text{MONTH} \]

\[ \text{month} : = \text{MONTH} \]

referenced by:
- functionExpression

**newid:**

Creates a new Guid id.

Returns: The new Guid id.

\[ \text{NEWID} \]

\[ \text{newid} : = \text{NEWID} \]

referenced by:
- functionExpression

**nvl:**

Coalesce all values together.

Returns: All values coalesced together.

\[ \text{NVL} \]

\[ \text{nvl} : = \text{NVL} \]

referenced by:
- functionExpression

**plus:**

Adding a value to another.

Parameters:
- Value: a number or datetime.
- add: a number or datetime.

Returns: A new value with both values added to each other. PLUS

\[ \text{PLUS} \]

\[ \text{plus} : = \text{PLUS} \]

referenced by:
- arithmeticExpression

**power:**

Gets a value of a number raised to another.

Parameters:
- Value: a number.
- exponent: a number.
Returns: The value of a number raised to another. POWER

\[
power \ ::= \ POWER
\]

referenced by:

- functionExpression

random:
Generates a random number between 0 and 1.

Parameters:
- Seed: Produce a repeatable sequence of random numbers each time that seed value is provided.

Returns: A random number between 0 and 1. RANDOM

\[
random \ ::= \ RANDOM
\]

referenced by:

- functionExpression

random_blob:
Generates a blob with pseudo-random values.

Parameters:
- Length: Produce a blob with this length in terms of bytes.

Returns: A blob with pseudo-random values. RANDOM_BLOB

\[
random\_blob \ ::= \ RANDOM\_BLOB
\]

referenced by:

- functionExpression

rand:
RAND

\[
rand \ ::= \ RAND
\]

referenced by:

regexp_substr:
Extracts a substring from the given value using regular expression.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the substr operation.
- Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The substring from the input. 
\[
\text{regexp_substr} \\
::= \text{REGEXP_SUBSTR}
\]

\[
\text{regexp_substr}
::= \text{REGEXP_SUBSTR}
\]

referenced by:
- \[\text{functionExpression}\]

\[
\text{regexp_instr} \\
::= \text{REGEXP_INSTR}
\]

Determine the position of the regular expression in the given value. Returns 0 when the regular expression is not contained in the given value.

Parameters:
- Input: The text to get the regular expression position from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the instr operation.
- ReturnOption [optional]: Select either the first character found or the first character after the occurrence of the pattern.
- Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The location of a regular expression pattern in the input. 
\[
\text{regexp_instr} \\
::= \text{REGEXP_INSTR}
\]

\[
\text{regexp_instr}
::= \text{REGEXP_INSTR}
\]

referenced by:
- \[\text{functionExpression}\]

\[
\text{regexp_replace} \\
::= \text{REGEXP_REPLACE}
\]

Replaces all occurrences matching the regular expression with the replacement value. The replacement value may contain references to matches in the regular expression by using the dollar-sign ('$') plus the reference number.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Replacement [optional]: Text to replace with.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the replace operation.
• Match parameter [optional]: A text literal that lets you change the default matching behavior of the function. The available options are 'c' for case-sensitive, 'i' for ignore case, 'n' for single-line, 'm' for multi-line and 'x' for ignore pattern white space.

Returns: The input with every occurrence of the regular expression pattern replaced with the replacement.

```sql
REGEXP_REPLACE
  regexp_replace
::= REGEXP_REPLACE
```

referenced by:
• `functionExpression`

**remainder:**

Get the remainder of a divide calculation.

The REMAINDER function uses the round function in its formula, whereas the MOD function uses the floor function in its formula.

Parameters:
• Number1: a number.
• Number2: a number.

Returns: The remainder.

```sql
REMAINDER
  remainder
::= REMAINDER
```

referenced by:
• `functionExpression`

**replace:**

Replaces a string with string in given string.

Parameters:
• Input: the string to replace a string in.
• Old text: the string to be replaced.
• New text: the string which 'Old text' will be replaced with.

Returns: A string with the replaced string.

```sql
REPLACE
  replace
::= REPLACE
```

referenced by:
• `functionExpression`

**reverse:**

Flips the input around.

Parameters:
• Input: text to flip around.

Returns: The text with it's characters in reversed order.

```sql
REVERSE
```
reverse::= REVERSE

referenced by:
  • functionExpression

round:
Rounds the input to the closest following integer. Unless an amount of decimals is defined, in which case it rounds to the closest integer number with the amount of decimals or date with the amount of positions.

Parameters:
  • Input: A number or datetime to round.
  • Decimals [optional]: A number to specify how many decimals it may round to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The rounded input. ROUND

row_number:
ROW_NUMBER

referenced by:
  • functionExpression

rpad:
Rightpad function pads the right-side of a string with a specific set of characters to the given length. When no set of characters given, it will pad with a whitespace.

Parameters:
  • Input: Text to be padded.
  • Length: The length to make the input to.
  • Pad text [optional]: Text to add to the input if the length is larger then the input.

Returns: The padded text, or null if the string cannot be padded. RPAD

rtrim:
Trims characters from the right side of a string.

Parameters:
Input: the string from which to trim characters from the right side.
(Optional) Chars to trim: the character to trim. Default is "."

Returns: A string with chars trimmed from the right. RTRIM

```
rtrim[82] ::= RTRIM[82]
```

Referenced by:

- functionExpression[82]

**microsecond:**

Collect the microsecond from a date.

Parameters:

- Input: A dateTime.

Returns: The microsecond as an integer. MICROSECOND

```
microsecond[83] ::= MICROSECOND[83]
```

Referenced by:

- functionExpression[82]

**millisecond:**

Collect the millisecond from a date.

Parameters:

- Input: A dateTime.

Returns: The millisecond as an integer. MILLISECOND

```
millisecond[83] ::= MILLISECOND[83]
```

Referenced by:

- functionExpression[82]

**number_to_speech:**

NUMBER_TO_SPEECH

```
number_to_speech[83] ::= NUMBER_TO_SPEECH[83]
```

Referenced by:

- functionExpression[82]

**normalize:**

Normalize a file path by replacing all invalid and non-ASCII characters for use in a file path by underscore. After that, the file path is made more readable by various operations such as removal of duplicate whitespace and underscore characters.

Parameters:

- Original file path: path of the file.
- Maximum file name length: length in characters into which the normalized file name must fit.
- Allow path separator: whether to allow the path separator '\' in the normalized file name.
  When not, occurrences are replaced.

Returns: a normalized file path. 

\[
\text{normalize} \quad ::= \quad \text{NORMALIZE}
\]

referenced by:
- \text{functionExpression}

\textbf{second}:
Collect the second from a date.

Parameters:
- Input: A dateTime.

Returns: The second as an integer. 

\[
\text{second} \quad ::= \quad \text{SECOND}
\]

referenced by:
- \text{functionExpression}

\textbf{soundex}:
Converts a value to the Soundex code as defined on Wikipedia.

Parameters:
- Input: Text to that retrieve the soundex value from.

Returns: A text started with a number and followed by 3 digits. 

\[
\text{soundex} \quad ::= \quad \text{SOUNDEX}
\]

referenced by:
- \text{functionExpression}

\textbf{sin}:
Returns the sine of the provided angle.

Parameters:
- Input: the angle to get the sine of.

Returns: A number which represents the sine of the provided angle. 

\[
\text{sin} \quad ::= \quad \text{SIN}
\]

referenced by:
- \text{functionExpression}

\textbf{sqrt}:
Returns the square root of the provided number.
Parameters:
- **Input**: the number to get the square root of.

Returns: A number which represents the square root of the provided number. SQRT
\[
\text{sqrt} \quad ::= \quad \text{SQRT}
\]

referenced by:
- `functionExpression`

`substr`:

Gets a substring from the input.

Parameters:
- **Input**: text to gather the substring from.
- **Start**: start position.
- **Length**: maximum length of the substring.

Returns: The substring from the original input. SUBSTR
\[
\text{substr} \quad ::= \quad \text{SUBSTR}
\]

referenced by:
- `functionExpression`

`sys_context`:

Text value of a parameter associated with a context.

Parameters:
- **context**: a namespace.
- **parameter**: name of the parameter.

Solely the namespace USERENV is available with the following parameter names:
- **APPLICATION_VERSION**: version of the client application.
- **APPLICATION_FULL**: name and version of the client application.
- **APPLICATION_BUILD_EXPIRATION_DATE**: build expiration date of the client application.
- **AUTHENTICATION_METHOD**: current authentication method.
- **CLIENT_IP_ADDRESS_INTERNAL**: internal IP address of the client device.
- **CLIENT_IP_ADDRESS_EXTERNAL**: external IP address of the client device.
- **CLIENT_LOGICAL_CORE_COUNT**: number of logical processor cores in the client device.
- **CLIENT_MACHINE_NAME**: machine name of the client device.
- **CLIENT_SYSTEM_64_BIT**: whether the OS is 64-bit on the client device.
- **CLIENT_SYSTEM_NAME**: full OS name running on the client device.
- **CLIENT_SYSTEM_DIRECTORY**: system directory of the client device.
- **CLIENT_SYSTEM_PAGE_SIZE**: system page size of the client device.
- **CLIENT_VIRTUAL_MACHINE**: whether the client device is a virtual machine.
- **CLR_VERSION_BUILD**: build version of the Common Language Runtime.
- **CLR_VERSION_MAJOR**: major version of the Common Language Runtime.
- **CLR_VERSION_MAJOR_REVISION**: major revision of the Common Language Runtime.
• CLR_VERSION_MINOR: minor version of the Common Language Runtime.
• CLR_VERSION_MIN_REVISION: minor revision of the Common Language Runtime.
• COMPANY_ID: ID of the company of current user.
• COMPANY_NAME: name of the company of current user.
• COMPANY_PHONE: phone of the company of current user.
• COMPANY_WEB_SITE: web site of the company of current user.
• DATA_CONTAINER_ALIAS: alias of active data container.
• DATA_CONTAINER_ID: ID of active data container.
• DATABASE_DESCRIPTION: description of database.
• DATABASE_FULL_NAME: full name of database.
• DATABASE_VERSION: version of database.
• LANG: ISO abbreviation for the language name of the user. Alternative:
  USER_LANGUAGE_CODE.
• MODULE: name of the client application. Alternative: APPLICATION_NAME.
• PROCESS_64_BIT: whether the OS process on the client device runs as 64-bit.
• PROCESS_COMMAND_LINE: command line used to start the OS process.
• PROCESS_CURRENT_DIRECTORY: current directory of the OS process.
• PROCESS_STACK_TRACE: current stack trace of the OS process.
• PROCESS_WORKING_SET: working set of the OS process.
• PROVIDER_DESCRIPTION: description of active data container.
• PROVIDER_DOCUMENTATION_URL: documentation (URL) of active data container.
• PROVIDER_DOWNLOAD_IMPLEMENTATION_URL: download driver (URL) of active data container.
• PROVIDER_NAME: name of active data container.
• PROVIDER_SHORT_NAME: short name of active data container.
• PROVIDER_TECHNICAL_DOCUMENTATION_URL: technical documentation (URL) of active data container.
• SESSION_USER: log on code of the current user. Alternative: CURRENT_USER.
• SESSIONID: session ID of current session.
• USER_DOMAIN_NAME: Windows domain name of current user.
• USER_EMAIL_ADDRESS: email address of current user.
• USER_FIRST_NAME: first name of current user.
• USER_FULL_NAME: full name of current user.
• USER_GENDER: gender of current user.
• USER_HOME_DIRECTORY: home directory of current user on client device.
• USER_INTERACTIVE: whether the current user works interactive.
• USER_PICTURES_DIRECTORY: pictures directory of current user on client device.
• USER_FAVORITES_DIRECTORY: favorites directory of current user on client device.
• USER_DESKTOP_DIRECTORY: desktop directory of current user on client device.
• USER_DOCUMENTS_DIRECTORY: documents directory of current user on client device.
• USER_PROFILE_DIRECTORY: profile directory of current user on client device.
• USER_LAST_LOG_ON: time of last log on of current user.
• USER_LAST_NAME: last name of current user.
• USER_LINKED_IN: LinkedIn name of current user.
• USER_MIDDLE_NAME: middle name of current user.
• USER_MOBILE_NUMBER: mobile number of current user.
• USER_NATIONALITY: nationality of current user.
• USER_PHONE_NUMBER: phone number of current user.
• USER_PICTURE_URL: picture URL of current user.
• USER_SKYPE: Skype name of current user.
• USER_TITLE: title of current user.
• USER_TWITTER: Twitter name of current user.
• USER_WEB_SITE: personal web site of current user.

Returns: Value of the parameter in the context namespace. SYS_CONTEXT

\[
\text{sys	extunderscore context} = \text{SYS	extunderscore CONTEXT}
\]

referenced by:
• functionExpression

\[\text{tan} = \text{TAN}\]

\[\text{times} = \text{ASTERIX}\]

\[\text{translate}\]

Translate replaces all occurrences of each character in from_string to its corresponding character in to_string.

Parameters:
• input: The string to replace a sequence of characters with another set of characters.
• from_string: The string that will be searched for in the input.
• to_string: All characters in the from_string will be replaced with the corresponding character in the to_string.
Returns: the input with all occurrences of each character in from_string replaced by its corresponding character in to_string. TRANSLATE

```
translate ::= TRANSLATE
```

translated by:
- `functionExpression`

**translate_resources:**
Replace all Invantive-style resources (`{res:...}`) by their translation in the current language.

Parameters:
- `txt`: The string to replace resources in.

Returns: the input with all resources replaced by their translation.

```
translate_resources ::= TRANSLATE_RESOURCES
```

translated by:
- `functionExpression`

**trim:**
Trims whitespaces from both sides of the provided string.

Parameters:
- `Input`: the string from which to trim characters.

Returns: A string trimmed from whitespaces from both sides.

```
trim ::= TRIM
```

translated by:
- `functionExpression`

**trunc:**
Calculates the integral part of a number. Unless an amount of decimals is defined, in which case it calculates to the integer with the amount of decimals or date with the amount of positions.

Parameters:
- `Input`: A number or datetime to truncate.
- `Decimals [optional]`: A number to specify how many decimals it may truncate to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The truncated input.

```
trunc ::= TRUNC
```

translated by:
- `functionExpression`
to_hex:

TO_HEX

\[\text{to_hex} ::= \text{TO\_HEX}\]

referenced by:

- functionExpression

unistr:

Converts a text with unicodes to regular characters.

Parameters:

- **Input**: text with unicodes.

Returns: The input converted to all regular characters. UNISTR

\[\text{unistr} ::= \text{UNISTR}\]

referenced by:

- functionExpression

upper:

Converts provided string to uppercase.

Parameters:

- **Input**: the string that will be converted to uppercase.

Returns: A string converted to uppercase. UPPER

\[\text{upper} ::= \text{UPPER}\]

referenced by:

- functionExpression

urlencode:

Decodes a url.

Parameters:

- **Url**: url to decode.

Returns: The decoded url. URLDECODE

\[\text{urlencode} ::= \text{URLDECODE}\]

referenced by:

- functionExpression

urlencode:

Encodes a url.

Parameters:
- Url: url to encode.

Returns: The encoded url. URLENCODE

\[ \text{urlencode} \]

::= URLENCODE

referenced by:
- \[ \text{functionExpression} \]

unix_timestamp:

Get the UNIX epoch time of a date/time.

Parameters:
- Input: A dateTime. Current date/time is used when no value is specified.

Returns: The UNIX epoch time. UNIX_TIMESTAMP

\[ \text{unix_timestamp} \]

::= UNIX_TIMESTAMP

referenced by:
- \[ \text{functionExpression} \]

unzip:

UNZIP

\[ \text{unzip} \]

::= UNZIP

referenced by:
- \[ \text{functionExpression} \]

zip:

ZIP

\[ \text{zip} \]

::= ZIP

referenced by:
- \[ \text{functionExpression} \]

xmlcomment:

Format a text as an XML comment.

Parameters:
- Input: the input which will be formatted as XML comment.

Returns: A text with the input as XML comment. XMLCOMMENT

\[ \text{xmlcomment} \]

::= XMLCOMMENT

referenced by:
- \[ \text{functionExpression} \]
xmldecode:
Returns the XML decoded input.
Parameters:
  • Input: the input which will be decoded into XML.
Returns: An object which is the XML decoded input. XMLDECODE
         xmldecode ::= XMLDECODE

referenced by:
  • functionExpression

xmlencode:
Returns the XML encoded input.
Parameters:
  • Input: the input which will be encoded into XML.
Returns: An object which is the XML encoded input. XMLENCODE
         xmlencode ::= XMLENCODE

referenced by:
  • functionExpression

gxmlelement:
XMLELEMENT
         xmlelement ::= XMLELEMENT

referenced by:
  • functionExpression

xmltransform:
Applies an XSL style sheet to the XML instance.
Parameters:
  • XML: XML type instance to be transformed with the XSL style sheet.
  • Style sheet: The XSL style sheet to apply.
Returns: The XML instance with the style sheet applied to it. XMLTRANSFORM
         xmltransform ::= XMLTRANSFORM

referenced by:
  • functionExpression

xmlformat:
Pretty-print xml text.

Parameters:
- Xml: xml to pretty-print.

Returns: The pretty-printed XML text. XMLFORMAT

```xmlformat::= XMLFORMAT```

referred by:
- `functionExpression`

`httpget`:

Collects all data from the URL as binary data.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- URL: the URL to collect the data from.

Returns: The collected data as an byte array. HTTPGET

```httpget::= HTTPGET```

referred by:
- `functionExpression`

`httpget_text`:

Collects all data from the URL as text.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- URL: the URL to collect the data from.
  - Encoding: the encoding from the data to receive, which is by default UTF8.

Returns: The collected data as text. HTTPGET_TEXT

```httpget_text::= HTTPGET_TEXT```

referred by:
- `functionExpression`

`httppost`:

HTTPPOST

```httppost::= HTTPPOST```

referred by:
- `functionExpression`
quarter:
Collect the quarter from a date.
Parameters:
- Input: A dateTime.
Returns: The quarter as an integer. QUARTER

```sql
QUARTER
```

referenced by:
- functionExpression

quote_ident:

```sql
QUOTE_IDENT
```

referenced by:
- functionExpression

quote_literal:

```sql
QUOTE_LITERAL
```

referenced by:
- functionExpression

quote_nullable:

```sql
QUOTE_NULLABLE
```

referenced by:
- functionExpression

user:

Gets the user log on code.
Returns: The user log on code.

```sql
USER
```
year:
Collect the year from a date.
Parameters:
  - Input: A date Time.
Returns: The year as an integer. YEAR
  \[\text{year} \quad ::= \quad \text{YEAR}\]

  referenced by:
    - \text{functionExpression}\[62\]

to_binary:
TO_BINARY
  \[\text{to_binary} \quad ::= \quad \text{TO_BINARY}\]

  referenced by:
    - \text{functionExpression}\[62\]

to_char:
Converts a value into text.
Parameters:
  - Input: value to convert.
Returns: The input converted to text. TO_CHAR
  \[\text{to_char} \quad ::= \quad \text{TO_CHAR}\]

  referenced by:
    - \text{functionExpression}\[62\]

to_date:
Converts a value into a datetime.
Parameters:
  - Input: value to convert.
Returns: The input converted to a datetime. TO_DATE
  \[\text{to_date} \quad ::= \quad \text{TO_DATE}\]

  referenced by:
    - \text{functionExpression}\[62\]

to_guid:
Converts a value into a guid.
Parameters:
  - Input: value to convert.
Returns: The input converted to a guid.

Converts a value into a number.

Parameters:
- Input: value to convert.

Returns: The input converted to a number.

\[
\text{TO_GUID} \quad \text{to_guid}^{[94]} \quad ::= \quad \text{TO_GUID}^{[94]}
\]

Referenced by:
- functionExpression^{62}

**to_number:**

\[
\text{TO_NUMBER} \quad \text{to_number}^{[95]} \quad ::= \quad \text{TO_NUMBER}^{[95]}
\]

Referenced by:
- functionExpression^{62}

**zero_blob:**

Generates a blob with 0-byte values.

Parameters:
- Length: Produce a blob with this length in terms of bytes.

Returns: A blob with 0-byte values.

\[
\text{ZERO_BLOB} \quad \text{zero_blob}^{[96]} \quad ::= \quad \text{ZERO_BLOB}^{[96]}
\]

Referenced by:
- functionExpression^{62}

**now:**

The time of the system clock in local time at the device where Invantive SQL runs.

Returns: current date/time.

\[
\text{NOW} \quad \text{GETDATE} \quad \text{SYSDATETIME} \quad (\quad \text{NOW}^{[55]} \quad | \quad \text{GETDATE}^{[21]} \quad | \quad \text{SYSDATETIME}^{[27]} \quad ) \quad \text{SYSDATE}\quad \text{utc}^{[94]} \quad ::= \quad (\quad \text{NOW}^{[55]} \quad | \quad \text{GETDATE}^{[21]} \quad | \quad \text{SYSDATETIME}^{[27]} \quad ) \quad \text{SYSDATE}^{[21]}
\]

Referenced by:

- jsonTableSpec
- labeled
- resultSetName
- xmlTableColumnSpec
- xmlTableSpec

intervalConstant:
A constant interval value, reflecting the time span between two dates. The string constant consists of an integer number and unit of time, taken from the following list:

- Millisecond,
- second,
- minute,
- hour,
- day,
- week, and
- year.

The units may be postfixed with an 's' without changing meaning, like 'years'.

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Valid interval values are for example: "5 seconds", "20 hours" and "1 year". There is no support for combined intervals such as "30 minutes and 30 seconds".

```
INTERVAL stringConstant
  intervalConstant := INTERVAL stringConstant

referenced by:

null:
The "unknown" value null.

NULL

null::= NULL

referenced by:
- constant
- jsonTableSpec
- xmlTableSpec

pSqlBlock:
A PSQL block is a structure to define procedural logic. It can contain both procedural logic as well as SQL statements like "select".

pSqlDeclareSection pSqlBody

pSqlBlock::= pSqlDeclareSection? pSqlBody

referenced by:
- pSqlBlockOrStatement
- pSqlStatement

pSqlDeclareSection:
A PSQL declare section defines one or more local variables, which are available in the block and nested blocks.

DECLARE pSqlDeclaration

pSqlDeclareSection::= DECLARE pSqlDeclaration+

referenced by:
- pSqlBlock

pSqlDeclaration:
pSqlItemDeclaration

pSqlDeclaration::= pSqlItemDeclaration

referenced by:
- pSqlDeclareSection

pSqlItemDeclaration:
An item declaration defines one named variable, based upon data type. The initial value can be added as a constant.

```
pSqlItemDeclaration ::= variableName dataType ASSIGNMENT_OPERATOR constant BATCHSEPARATOR
```

referred by:
- `pSqlDeclaration`

**pSqlBody:**

A PSQL body contains the procedural logic as well as SQL statements. Variables must have been declared beforehand.

```
pSqlBody ::= BEGIN pSqlStatement END BATCHSEPARATOR
```

referred by:
- `pSqlBlock`

**pSqlStatement:**

A number of basic PSQL statements are available.

```
```

referred by:
- `pSqlBlockOrStatement`
- `pSqlBody`
- `sqlOrPSqlStatement`

**pSqlBlockOrStatement:**

A PSQL block or statement defines a procedural step or a SQL statement to be executed.

```
pSqlBlock pSqlStatement
```

referred by:
- `pSqlBlockOrStatements`
pSqlBlockOrStatements:

\[\text{pSqlBlockOrStatement} \quad \text{pSqlBlockOrStatements}^{108} \quad ::= \text{pSqlBlockOrStatement}^{107} +\]

referenced by:
- \text{pSqlElseIfExpression}^{109}
- \text{pSqlForNumberLoopStatement}^{110}
- \text{pSqlForRecordLoopStatement}^{110}
- \text{pSqlIfStatement}^{110}
- \text{pSqlWhileLoopStatement}^{110}

pSqlNullStatement:

The null-statement is a NOP-statement (No Operator). The use of the null-statement is necessary when a PSQL statement is needed, but no activity needs to be performed such as with an if statement. The null-statement also makes explicit that a developer has considered the actions needed and found that no action applies to a specific scenario. This leads to improved code documentation.

\[\text{NULL \ BATCHSEPARATOR} \quad \text{pSqlNullStatement}^{108} \quad ::= \text{NULL}^{108} \ \text{BATCHSEPARATOR}^{27}\]

referenced by:
- \text{pSqlStatement}^{107}

pSqlAssignmentStatement:

The assignment statement assign a new value to a variable. To assign the results of a SQL query to a value, use a select ... into ... statement.

\[\text{variableName \ ASSIGNMENT\_OPERATOR} \ \text{expression} \ \text{BATCHSEPARATOR} \quad \text{pSqlAssignmentStatement}^{108} \quad ::= \text{variableName}^{107} \ \text{ASSIGNMENT\_OPERATOR}^{27} \ \text{expression}^{57} \ \text{BATCHSEPARATOR}^{27}\]

referenced by:
- \text{pSqlStatement}^{107}

pSqlExecuteImmediateStatement:

The execute immediate PSQL statement enables the use of SQL statements that are compiled at runtime. For instance dynamic DDL statements can not always be executed on compiled time and the execute immediate enables these.

\[\text{EXECUTE IMMEDIATE} \ \text{expression} \ \text{BATCHSEPARATOR} \quad \text{pSqlExecuteImmediateStatement}^{108} \quad ::= \text{EXECUTE}^{27} \ \text{IMMEDIATE}^{27} \ \text{expression}^{57} \ \text{BATCHSEPARATOR}^{27}\]
**pSqlIfStatement:**

The if-statement performs conditional logic. When the boolean expression after if holds, the PSQL block after the 'then' will be executed. Other branches can be specified using an elsif. Otherwise, and only when specified, the logic after the else is executed.

```
IF booleanExpression THEN pSqlBlockOrStatements pSqlElsIfExpression ELSE pSqlBlockOrStatements END IF
```

**pSqlElsIfExpression:**

ELSIF booleanExpression THEN pSqlBlockOrStatements

```
ELSIF booleanExpression THEN pSqlBlockOrStatements
```

---

**pSqlLoopStatement:**

A variety of PSQL statements for loops are available.

```
pSqlLoopStatement ::= pSqlForNumberLoopStatement | pSqlForRecordLoopStatement | pSqlWhileLoopStatement
```

**pSqlForNumberLoopStatement:**

This PSQL integer loop statement iterates over a range of integer values, executing PSQL statements for each iterated value. The iterations goes from the first value to the last value in increments of 1. The iterations go backward in decrements of 1 when 'reverse' is specified.

```
FOR variableName IN REVERSE numericConstant variableName DOT DOT numericConstant variableName LOOP pSqlBlockOrStatements END LOOP
```
pSqlForNumberLoopStatement::= FOR variableName IN REVERSE? ( numericConstant | variableName ) DOT DOT ( numericConstant | variableName ) LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

referenced by:

- pSqlLoopStatement

pSqlForRecordLoopStatement:

This PSQL result set loop statement iterates over a result set returned by an Invantive SQL query. The PSQL statements are executed for each record. The record's specific values can be retrieved using the variable.

FOR variableName IN PARENTHESES_OPEN selectStatement PARENTHESES_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

pSqlForRecordLoopStatement::= FOR variableName IN PARENTHESES_OPEN selectStatement PARENTHESES_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

referenced by:

- pSqlLoopStatement

pSqlWhileLoopStatement:

This PSQL while loop statement executes PSQL statements as long as the specified boolean condition evaluates to true at loop end.

WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

pSqlWhileLoopStatement::= WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

3.2 Providers

The providers described here are available on all platforms.

3.2.1 Provider Atom10

Atom version 1.0.

Code for use in settings.xml: Atom10

Alias: atom

Status: Production

Available in Editions: Paid, Open Data, Community

3.2.2 Provider AutoTask

AutoTask service management.

Code for use in settings.xml: AutoTask

Alias: autotask

Status: Non-production

Available in Editions: Paid

Non-technical Documentation: http://severa.visma.com

3.2.3 Provider CbsNl

Centraal Bureau voor de Statistiek.

Code for use in settings.xml: CbsNl

Alias: cbsnl

Status: Production

Available in Editions: Paid, Open Data, Community

3.2.6 Provider DataDictionary

Invantive SQL data dictionary.

Code for use in settings.xml: DataDictionary
Alias: dd
Abbreviation: dd
Status: Production
Available in Editions: Paid
String-comparison is Case-sensitive: true
Use Catalog in Full Name: true
Use Schema in Full Name: true
Updated: 10-09-2020 00:07 using Invantive SQL version 20.1.206-BETA+2915.

## Connector Attributes

The Data Dictionary connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>bulk-insert-page-size-bytes</td>
<td>Approximate maximum size in bytes of batch when bulk inserting</td>
<td>10000000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per batch when bulk inserting</td>
<td>10000</td>

3.2.16 Provider Freshdesk

Freshdesk, customer happiness for exceptional customer service.

Code for use in settings.xml: Freshdesk

Alias: freshdesk
Status: Production
Available in Editions: Paid

**Documentation**

**Authentication**

Authentication can be done using one of the following two alternatives:

1. Using the user log on code, password and company also used on the Freshdesk website.
2. Using an API key and company.

Authentication using user log on code and password is recommended for general use. The company is the name before '.freshdesk.com' in the URL used to log on to Freshdesk in a browser.

The API key can be found in the 'Edit Profile' page in Freshdesk, as described on https://support.freshdesk.com/support/solutions/articles/225435-where-can-i-find-my-api-key.

**Usage Limits**

Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per hour depends on your Freshdesk plan. The default usage limits vary between 1,000 and 5,000 calls per hour. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

**Provider Attributes**

The following provider attributes are available for Freshdesk:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>

### 3.2.24 Provider KeePass

Security-sensitive storage of keys.

Code for use in settings.xml: KeePass

Alias: KeePass

Abbreviation: kp

Status: Non-production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Updated: 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

#### Connector Attributes

The KeePass connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>use-http-disk-cache-read</td>
<td>Whether to use HTTP responses from previous queries stored on disk to answer the current query.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>use-http-disk-cache-write</td>
<td>Whether to memorize HTTP responses on disk.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>use-http-memory-cache-read</td>
<td>Whether to use HTTP responses from previous queries stored in memory that can answer the current query.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>use-http-memory-cache-write</td>
<td>Whether to memorize HTTP responses from previous queries for use by future queries.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Code</th>

3.2.47 Provider Salesforce: Salesforce CRM and other applications.

Salesforce CRM and other applications.

Code for use in settings.xml: Salesforce

Alias: sf

Status: Production

Available in Editions: Paid

Technical Documentation: [https://developer.salesforce.com](https://developer.salesforce.com)
Non-technical Documentation: [https://salesforce.com](https://salesforce.com)

**Provider Attributes**

The following provider attributes are available for Salesforce:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>api-client-id</td>
<td>The client ID is a unique identifier of your application. It is generated by registering an application.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-client-secret</td>
<td>The client secret is to be kept confidential. Such as a password for a login code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-redirect-url</td>
<td>The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-refresh-token</td>
<td>Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-url</td>
<td>URL to access the API.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-max-tries</td>
<td>Maximum number of tries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-sleep-initial-ms</td>
<td>Initial sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-sleep-max-ms</td>
<td>Maximum sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow n-sleep-multiplier</td>
<td>Multiplication factor for sleep between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-compression-level</td>
<td>Compression level for the HTTP disk cache, ranging from 1 (little) to 9 (intense). Default is 5.</td>
<td>5</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-directory</td>
<td>Directory where HTTP cache is stored.</td>
<td>C:sers\gle3\Invantive\Cache</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-max-age-sec</td>
<td>Maximum acceptable age in seconds for use of data in the HTTP disk cache.</td>
<td>2592000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-get-timeout-ms</td>
<td>HTTP GET timeout (ms).</td>
<td>300000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from Set SQL-Statement</td>
<td>Set from Providers File</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
<td>----------------------------</td>
<td>----------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>http-memory-cache-compression-level</td>
<td>Compression level for the HTTP memory cache, ranging from 1 (little) to 9 (intense). Default is 5.</td>
<td>5</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-memory-cache-max-age-sec</td>
<td>Maximum acceptable age in seconds for use of data in the HTTP memory cache.</td>
<td>14400</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-post-timeout-ms</td>
<td>HTTP POST timeout (ms).</td>
<td>300000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>ignore-http-400-errors</td>
<td>Ignore HTTP 400 errors when exchanging results with the OData endpoint.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>ignore-http-403-errors</td>
<td>Ignore HTTP 403 errors when exchanging results with the OData endpoint.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>ignore-http-429-errors</td>
<td>Ignore HTTP 429 errors when exchanging results with the OData endpoint.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-forward-filters-to-data-containers</td>
<td>Whether to forward filters to data containers.</td>
<td>True</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>invantive-sql-shuffle-fetch-results-data-containers</td>
<td>Whether to shuffle results fetched from data containers.</td>
<td>False</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>invantive-use-cache</td>
<td>Whether to cache the results of a query.</td>
<td>True</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>join-set-points-per-request</td>
<td>Maximum number of values in a request when executing a join set.</td>
<td>60</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-length-identifiers</td>
<td>Non-default maximum length in characters of identifier names.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

3.2.52 Provider SqlServer: Microsoft SQL Server.

Microsoft SQL Server.
Code for use in settings.xml: SqlServer
Alias: mssql
Status: Production
Available in Editions: Paid

## Provider Attributes

The following provider attributes are available for SqlServer:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per page when bulk inserting</td>
<td>1000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-timeout-sec</td>
<td>Number of seconds after which a bulk insert times out</td>
<td>300</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>command-timeout-sec</td>
<td>Number of seconds after which a command times out</td>
<td></td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>connection-string-async-add</td>
<td>Should the 'Async' be added automatically to the connection string?</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>connection-string-async-value</td>
<td>Size of the Async to be added to the connection string</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>connection-string-multiple-active-result-sets-add</td>
<td>Should the 'MultipleActiveResultSets' be added automatically to the connection string?</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>connection-string-multiple-active-result-sets-value</td>
<td>Value of MultipleActiveResultSets to be added to the connection string</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>

<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-shuffle-fetch-results-data-containers</td>
<td>Whether to shuffle results fetched from data containers.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-use-cache</td>
<td>Whether to cache the results of a query.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-length-identifiers</td>
<td>Non-default maximum length in characters of identifier names.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-number-of-pooled-connections</td>
<td>Maximum number of concurrent pooled connections.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-pooled-connection-ms</td>
<td>Maximum time in ms to wait for acquiring a free connection from a pool of connections.</td>
<td>30000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-unpooled-connection-ms</td>
<td>Maximum time in ms to wait for acquire a free connection when there is no connection pool.</td>
<td>60000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from Set SQL-Statement</td>
<td>Set from Providers File</td>

<tr>
<td>api-url</td>
<td>URL to access the API.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>authentication-key</td>
<td>The authentication key of the app on StackApps.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-down-max-tries</td>
<td>Maximum number of tries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-down-sleep-initial-ms</td>
<td>Initial sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-down-sleep-max-ms</td>
<td>Maximum sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-down-sleep-multiplier</td>
<td>Multiplication factor for sleep between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mxed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-compression-level</td>
<td>Compression level for the HTTP disk cache, ranging from 1 (little) to 9 (intense). Default is 5.</td>
<td>5</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-directory</td>
<td>Directory where HTTP cache is stored.</td>
<td>C:\Users\gle3\Invantive\Cache</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-disk-cache-max-age-sec</td>
<td>Maximum acceptable age in seconds for use of data in the HTTP disk cache.</td>
<td>2592000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-get-timeout-ms</td>
<td>HTTP GET timeout (ms).</td>
<td>300000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>http-memory-cache-compression-level</td>
<td>Compression level for the HTTP memory cache, ranging from 1 (little) to 9 (intense). Default is 5.</td>
<td>5</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from Set SQL-Statement</td>
<td>Set from Providers File</td>
</tr>

Status: Non-production

Available in Editions: Paid

Non-technical Documentation: http://www.sepaforcorporates.com/swift-for-corporates/account-statement-mt940-file-format-overview/

**Provider Attributes**

The following provider attributes are available for SwiftMt940Rabo:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>directories</td>
<td><code>{res:itgen_provider_attribute_directories_description}</code></td>
<td>c:\temp</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>extension</td>
<td><code>{res:itgen_provider_attribute_extension_description}</code></td>
<td>*swi</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from U unset, Lower, Upper and Mixed.</td>
<td></td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-forward-filters-to-data-containers</td>
<td>Whether to forward filters to data containers.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-sql-shuffle-fetch-results-data-containers</td>
<td>Whether to shuffle results fetched from data containers.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-use-cache</td>
<td>Whether to cache the results of a query.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>log-directory</td>
<td>Directory where the text messages are stored</td>
<td>c:\temp</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>log-text</td>
<td>Whether to log the text messages exchanged to disk</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-length-identifiers</td>
<td>Non-default maximum length in characters of identifier names.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>pre-request-delay-ms</td>
<td>Pre-request delay in milliseconds per request</td>
<td>0</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>requests-parallel-max</td>
<td>Maximum number of parallel data requests from individual partitions on the data container.</td>
<td>32</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>slot-based-rate-limit-length-ms</td>
<td>Length in ms of a slot-based rate limit.</td>
<td>60000</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>standardize-identifiers</td>
<td>Rew rite all identifiers to the preferred standards as configured by standardize-identifiers-casing and maximum-length-identifiers.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>
### Code for use in settings.xml: Teamleader

**Alias:** teamleader  
**Abbreviation:** tlr  
**Status:** Production  
**Available in Editions:** Paid  
**String-comparison is Case-sensitive:** true  
**Use Catalog in Full Name:** true  
**Use Schema in Full Name:** true

**Updated:** 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

**Technical Documentation:** [http://apidocs.teamleader.be/](http://apidocs.teamleader.be/)

### Documentation

**Authentication**

Authentication can be done using one of the following two alternatives:

1. Using the user log on code and password also used on the Teamleader website.
2. Using an API group and API secret.

Authentication using user log on code and password is recommended for general use. The user must have access to all functionality since by default all so-called 'scopes' are requested. The scopes can be manually entered to be able to log in with a restricted accounts. Please provide a space-separated list chosen from companies, contacts, deals, departments, events, invoices, products, projects, quotations, subscriptions, tickets, todos, users.

The API group and secret can be found on https://app.teamleader.eu/apiwebhooks.php?show_key.

**Usage Limits**
Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per 5 seconds is 25. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Custom Fields

Custom fields for which one value can be entered on an object are added to the table representing the object. For instance, a custom field 'needsaudit' on 'project', will be added as a column 'c_needsaudit' on the 'project' table. The name of the additional column directly derives from the custom field name. Almost all changes, including adding numbers or reading characters, will result in the data model being changed.

Custom fields which can have no, one or multiple values ('set' custom fields) are reflected in the data model by tables with a name constructed of the object name, an underscore plus the name of the custom field. For example, a custom field named 'Multiple Selection' on 'Task' will add a table 'task_multipleselection' to the data model.

Custom fields are unique to each Teamleader environment. When the existence of specific custom field is not guaranteed, please use generic solutions like the tables 'CustomFieldDefinitions', 'custom_fields', 'custom_field_options', 'custom_field', 'Custom_Fields_All', 'Custom_Field_Types' and their object-specific custom field value tables like 'ticket_custom_field_values_by_id'.

**Connector Attributes**

The Teamleader connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>Description</td>

3.2.73 Providers

The providers described here are available on all platforms.
3.3 Configuration

3.3.1 Network

The list of available databases is maintained in so-called 'settings.xml' files. These file names all start with 'settings' and end with '.xml'.

Interactive and OS-Applications

A default file 'settings.xml' is placed in the user's home directory folder 'Invantive' during discovery of databases in interactive or OS-applications. Additional settings files may be placed in this folder too.

Web Applications

For web applications, the folder App_Data/Config must contain the settings.xml files. Additional settings files may be placed in this folder too.

Additional Locations

Using the environment variable INVANTIVE_SETTINGS_FILE_PATH, you can specify a different file name and path for the default settings.xml file.

Settings.xml is not searched for at other locations.

Structure

The settings files all have the following structure in XML format; The full specification is available in xsd format and online.

3.3.2 License

The license key controls the availability of functionality, providers and limits of your Invantive products. A license key is associated with a license contract. A license contract has a unique code consisting of a 'L' plus a number. Each license contract can have multiple license keys.
License keys are automatically revoked when they have not been used for three months.

When a license contract concerns a subscription, the contract is automatically ended when it has not been used for three months.

**Interactive and OS-Applications**

For interactive and OS-applications, a file named 'invantive.lic' is searched within the user's home directory folder 'Invantive'. The license key for use of Invantive products is normally stored within the product’s configuration files after loading it through the user interface of the product.

**Web Applications**

For web applications, a file named 'invantive.lic' is searched within the folder 'App_Data/Config'.

**Additional Locations**

Using the environment variable `INVANTIVE_LICENSE_FILE_PATH`, you can specify a deviating location for the default license file 'invantive.lic'.

### 3.3.3 Logging

#### 3.3.3.1 Trace

During use of the products, a continuous stream of relevant trace messages is being sent to the trace listeners. On Microsoft Windows, you can use the Microsoft program 'dbgview.exe' to see the trace messages.

Trace options are only available when the environment variable 'INVANTIVE_TRACE_ACTIVE' is set to any non-empty value.

The trace messages are also stored in trace files when the environment variable 'INVANTIVE_TRACE_TO_FILE' is set to 'true'.

The default location of the trace files is the folder for temporary files on interactive and OS-applications. The default location for web applications is 'App_Data\Trace'. An alternative folder for trace files can be specified by setting the environment variable 'INVANTIVE_TRACE_FOLDER'.

A limited amount of information is sent to the trace when an error occurs. The call stack and the natural key can be sent to trace by setting the environment variable 'INVANTIVE_TRACE_OWN_EXCEPTIONDETAILS' to 'true'.

**Log to Amazon CloudWatch**

The trace can be logged to Amazon CloudWatch by configuring the following environment variables:

- `INVANTIVE_TRACE_TO_CLOUDWATCH`: change to True to activate logging to CloudWatch
- `INVANTIVE_TRACE_CLOUDWATCH_ACCESS_KEY`: the access key as generated on Amazon.
- `INVANTIVE_TRACE_CLOUDWATCH_SECRET_KEY`: the corresponding secret key.
- `INVANTIVE_TRACE_CLOUDWATCH_REGION`: the geographical region to log the messages.
- **INVANTIVE_TRACE_CLOUDWATCH_GROUP**: the log group to use for logging. The identity associated with the access key must allow logging to CloudWatch. Amazon CloudWatch logging is rate limited. Messages may not be logged during periods of intensive activity. The log format is JSON-based as shown:

![CloudWatch Log Events](image)

**Microsoft Power BI**

When used in combination with Microsoft Power BI, please note that Power BI tries to disable all trace logging by third party drivers. Invantive SQL has limited tracing available through Power BI. To activate: in Power BI go to 'Options and Settings', then 'Options' and choose 'Diagnostics' in the Global group. Place a checkmark next to 'Enable tracing'. This setting will remain effective till you restart Microsoft Power BI.

**Direct Trace**

Trace messages generated by Invantive can also be logged to file outside the Microsoft .NET trace mechanism. This is called "direct trace".

The advantages of direct trace are:

- Direct trace starts very early in program execution, even before the normal trace mechanism is activates. It therefore allows analysis of start-up problems.
- Direct trace works independent of the normal trace mechanism. It is therefore available even when the environment manages Microsoft .NET trace, such as with Power BI.

The disadvantages of direct trace are:

- The use of direct trace reduces performance significantly. Therefore only enable direct trace when needed.

To activate direct trace, please set the environment variable `INVANTIVE_DIRECT_TRACE_FILE_PATH` to the file path of the intended log file.

It is recommended to include the placeholder `{PID}` in the file name when you expect to run multiple OS-processes with direct trace.

A commonly used setting for `INVANTIVE_DIRECT_TRACE_FILE_PATH` is `c:\temp\invantive-direct-trace-{PID}.log`. 
Mac OSX and Linux

Set the environment variable COMPlus_DebugWriteToStdErr to write trace messages to the console of Microsoft .NET Core applications:

```bash
export COMPlus_DebugWriteToStdErr=1
```

Note that the Microsoft .NET Core implementation on Mac OSX and Linux are restrained in the default stack size. On StackOverflowException such as with Exact Online, please increase stacksize first using:

```bash
export COMPlus_DefaultStackSize=10000000
```

### 3.3.3.2 Execution Log

Every completed execution of an Invantive product appends an entry to the local execution log. The execution log is in XML-format and located by default at `%USERPROFILE%\executionlog.xml`.

The name and location of the execution log can be altered by placing the full path and file name in the environment variable `INVANTIVE_EXECUTION_LOG_FILE`.

The root tag `EXECUTIONLOGS` contains an `EXECUTIONLOG` for every execution once finished. The following elements are available:

- **VERSION**: the record format, always '1'.
- **MESSAGEUID**: the UID of the message as registered on Invantive Cloud.
- **IID**: the Invantive Installation ID of the device.
- **SESSIONID**: the ID of the session.
- **LICENSECODE**: the code of the subscription contract.
- **LICENSEKEYID**: the numeric ID of the license key.
- **MACHINENAME**: the name of the device.
- **EXECUTABLENAME**: the name and path of the executable.
- **APPLICATIONNAME**: the name of the Invantive application.
- **APPLICATIONVERSION**: the version of the Invantive application.
- **USERNAME**: the name of the operating system user.
- **PROCESSID**: the ID of the OS process.
- **STARTTIMEUTC**: the start time of the process (UTC).
- **ENDTIMEUTC**: the end time of the process (UTC).
- **EXITCODE**: the exit code of the process.
- **EXITLEVEL**: the textual description of the exit code.
- **EXITMESSAGECODE**: the message code associated with the execution exit.
- **ISHEADLESS**: whether the process ran headless.
- **COMPUTERMANUFACTURER**: the name of the device's manufacturer.
3.3.4 Debugging

Invantive software products contain a number of features to aid analysis of problems.

3.3.4.1 Translations

During use of the products, the user interface is adapted to the user interface language based upon the environment.

The translation involves replacing so-called "resource codes" by their translation.

The translation can be disabled by setting the environment variable ‘INVANTIVE_NO_TRANSLATE’ to a non-empty value.

4 Invantive SQL for Windows

The Windows-specific features of Invantive SQL are documented in this section.

4.1 Internal Consistency Checks

Invantive SQL executes many internal consistency to ensure correctness of the results. Some of these consistency checks are only done during testing phases for reasons such as performance. These checks are automatically checked on testing environments and excluded on production environments.

However, during test or production use you can explicitly disable or enable these checks by setting environment variables to the value ‘true’ or ‘false’. The checks can individually be disabled or enabled, or all together.

To explicitly enable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to true. To explicitly disable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to false.

First determine with help of support the message code to explicitly enable or disable a consistency check. Then set the environment variable INVANTIVE_CHECK_<message code> to the correct value.

5 application.xml

The application.xml file in the App_Data/Config folder allows configuration of the behavior of the application.

The main structure is:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<WebApplicationSetting>
...
</WebApplicationSetting>
```

The following elements are available within WebApplicationSetting:

- `LogRequestProgress`: whether to log request to the App_Data/Log folder; unset, true or false (unset defaults to false).
• LogTraceToFile: whether to log trace events to the default files; unset, true or false (unset defaults to false).

• AccessControl: access control limitations (unset defaults to no restrictions).

• RateLimitControl: limitations on rate of use (unset defaults to no restrictions).

5.1 Access Control Limitations
The access control limitations control what requests may be served and what should return an error.

The element DefaultAllow specifies what the default action should be when no rule matches; unset, true or false, with unset defaults to true.

The list AccessControlList consists of multiple AccessControlElement elements.

AccessControlElement
Each AccessControlElement has the following elements, in which the first matching rule applies:

• Context: context to match against. A trailing '*' matches any sequence of characters. Unset defaults to always.

• Description: textual description of the rule. Has no further functional meaning.

• Url: URL to match against. A trailing '*' matches any sequence of characters. Unset defaults to always.

• ErrorCode: deviating error code to be returned upon rejection.

• ErrorMessage: deviating error message to be returned upon rejection.

• Allow: whether the rule causes rejection (false) or acceptance (true).

• ValidFrom: date at which the rule starts being applicable; unset defaults to always.

• ValidTo: date after which the rule no longer applies; unset defaults to always.

• LogOnCode: user log on code; unset always matches.

• DataContainerId: ID of a data container; unset always matches.

• IpAddressClientCidr: an IP address mask with number of significant bits, such as 8.8.0.0/16; unset always matches.

5.2 Rate Limits
The rate limitations control what how many requests may be served and when a delay should be introduced or an error returned.

The list RateLimitControlElementList consists of multiple ordered RateLimitControlElement elements.

The list RateLimitControlSlotList consists of multiple unordered RateLimitControlSlot elements.

RateLimitControlElement
Each RateLimitControlElement has the following elements, in which the first matching rule applies:

- **SlotName**: name of the rate limit slot to apply.
- **Context**: context to match against. A trailing '*' matches any sequence of characters. Unset defaults to always.
- **Description**: textual description of the rule. Has no further functional meaning.
- **Url**: URL to match against. A trailing '*' matches any sequence of characters. Unset defaults to always.
- **ValidFrom**: date at which the rule starts being applicable; unset defaults to always.
- **ValidTo**: date after which the rule no longer applies; unset defaults to always.
- **LogOnCode**: user log on code; unset always matches.
- **DataContainerId**: ID of a data container; unset always matches.
- **IpAddressClientCidr**: an IP address mask with number of significant bits, such as 8.8.0.0/16; unset always matches.

**RateLimitControlSlot**

Each RateLimitControlSlot has the following elements, in which the first matching rule applies:

- **Name**: name of the slot (required).
- **Description**: textual description of the rule. Has no further functional meaning.
- **ActionsPerSecond**: maximum number of actions per second; reset on every second switch. Unset defaults to no limitations.
- **ActionsPerMinute**: maximum number of actions per minute; reset on every minute switch. Unset defaults to no limitations.
- **ActionsPerHour**: maximum number of actions per hour; reset on every hour switch. Unset defaults to no limitations.
- **DelayMsOnOverflowSecond**: number of milliseconds to delay an answer when the second level rate limited is exceeded. Unset defaults to no delay.
- **DelayMsOnOverflowMinute**: number of milliseconds to delay an answer when the minute level rate limited is exceeded. Unset defaults to no delay.
- **DelayMsOnOverflowHour**: number of milliseconds to delay an answer when the hour level rate limited is exceeded. Unset defaults to no delay.
- **FailOnOverflowSecond**: whether to fail on an overflow on the second level rate limit. Unset defaults to true (fail).
- **FailOnOverflowMinute**: whether to fail on an overflow on the minute level rate limit. Unset defaults to true (fail).
- **FailOnOverflowHour**: whether to fail on an overflow on the hour level rate limit. Unset defaults to true (fail).
5.3 Application.xml Sample

The following sample implements the following settings:

- Log all requests to disk.
- Log trace events to the default file location.
- Allow access from any location at any moment.
- Limit calls to '/bras' to at most 2 calls per second. On failure, introduce an additional delay of 250 ms.
- Limit calls to '/Ping' to at most 50 calls per minute. On failure, introduce an additional delay of 6,000 ms.

Code:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<WebApplicationSetting>
  <LogRequestProgress>true</LogRequestProgress>
  <LogTraceToFile>true</LogTraceToFile>
  <AccessControl>
    <DefaultAllow>true</DefaultAllow>
  </AccessControl>
