1 Variants

Enter topic text here.

2 Command Line Arguments

Invantive Data Hub support the command line arguments in three modes:

- default,
- provider attributes, and
- Invantive Script variable values.

Initially, Invantive Data Hub only accepts arguments in default mode. To switch to provider attributes, use the default mode argument `attributes`. Use `variables` to switch to Invantive Script variable values.

Default Mode Arguments

In default mode the arguments are listed below in a long and abbreviated form (between parentheses):

- `help` (?): print a list of available command line arguments and exit.
- `interactive` (i): allows interaction with a user behind the console when "true", such as on errors. Otherwise disallow interaction. Default is "true".
- `file` (f): relative or absolute file path of the Invantive SQL file with instructions to execute.
- `user` (u): name of the user to be used for authentication on the database.
- `encryptedpassword` (e): password of the user to be used, encrypted by the device key. Only applied to data container with specified alias. Applies to data container without alias when no alias is specified.
- `password` (e): password of the user to be used in plain text. Only applied to data container with specified alias. Applies to data container without alias when no alias is specified.
- `connection` (c): full name of the database in the format ‘GROUP\NAME’.
- `logfile` (l): relative or absolute file path of the log file.
- `verbose` (v): print extensive progress messages when "true". Default is "false".
- `logoverwrite` (lo): overwrite an already existing log file when "true". Otherwise append to an existing log file. Default is "false".
- `licensekey` (lk): use the license key provided instead of the license key loaded from the user profile.
- `attributes` (a): switch to provider attributes mode.
- `variables` (v): switch to Invantive Script variable values mode.

The value of the argument is provided after the argument name and a colon (‘:’).

Multiple command line arguments can be provided in any order and in any form.

Provider Attributes Mode Arguments
In provider attributes mode, the following arguments are recognized:

- **name=value**: set the value of a provider attribute on the default data container to the specified fixed value.
- **name@alias=value**: set the value of a provider attribute on the data container with the specified alias to the specified fixed value.
- Any default mode argument.

### Invantive Script Variable Values Arguments

In Invantive Script variable values mode, the following arguments are recognized:

- **variable=value**: set the value of an Invantive Script variable on the default data container to the specified value, after expanding Invantive Script variables.
- Any default mode argument.

### Data Container Aliasing

The command line arguments **attribute**, **user** and **encryptedpassword** can be followed by the at-sign (@) and the alias of a data container. The value is then only used for the data container with the specified alias. When no alias is specified, the value is used on the data container without an alias.

### Log File Pattern

The file path of the log file may contain characters with a special meaning. These characters are expanded when the program starts:

- **%Y**: year.
- **%j**: day of year (001..366).
- **%m**: month (01..12).
- **%d**: day of month (01..31).
- **%u**: day of week (1..7).
- **%H**: hour (00..23).
- **%M**: minute (00..59).
- **%S**: second (00..59).
- **%D**: Windows domain name.
- **%U**: Windows user name.
- **%h**: Windows machine name.

Expansion takes place both in folder names as well as file name itself.

### Compliance

The command line argument **password** (p) is no longer supported as of 2018. Please use either interactive logins, preauthenticated connections or a password encrypted with the device key.
Example

The following command line arguments change:

- the database to the group 'WS203' with database 'invoicing',
- choose the SQL file 'c:\jobs\first-job.sql' to run,
- disable interaction,
- change the database to the group 'WS203' with database 'invoicing',
- choose the SQL file 'c:\jobs\first-job.sql' to run,
- disable interaction,
- change the Invantive Script variable 'MY_NAME' to 'John Doe':

```
```

3 Batch File

Invantive Data Hub is typically started from a batch file, such as below. The contents below can be used to create your own batch file, but it is far more easy to create such a batch file from Invantive Query Tool as follows:

- Start Invantive Query Tool.
- Run it on the same device as Invantive Data Hub must run the script to allow the generation of the correct password encrypted with the device key. When not possible, see Generate encrypted password.
- Log on to the database on which the script should run:
• Open the script.
• Go to the Editor menu.
• Choose the 'Create Data Hub Batch Script' menu option:

```
@echo off
```

• Fill out the form:

```
untilic.lvr_dlr_code
untilic.lvr_dlr_name
untilic.lvr_gbr_id
untilic.lvr_gbr_code
untilic.lvr_gbr_name
untilic.lvr_ecr_id
```

• Click on the Save button.
• Result will be a batch file like in Sample Batch File.

### 4 Sample Batch File

Invantive Data Hub is typically started from a batch file, such as below. The contents below can be used to create your own batch file, but it is far more easy to create such a batch file from Invantive Query Tool as described in Batch File.

```
@echo off
```
5 Generate encrypted password

A password can be encrypted using the device key using both Invantive Query Tool as well as using Invantive Data Hub. Such an encrypted password can only be decrypted on the device it was generated. Encrypting the password provides an extra line of defense for information security since it requires access to the device to decrypt it.

Note that the encryption used is based upon the less secure symmetric approach since most platforms connected to Invantive SQL do not support asymmetric encryption for authentication.

**Encryption with Invantive Query Tool**

Perform the following steps to encrypt a password with the device key using Invantive Query Tool:

- Start Invantive Query Tool.
Log on.

Enter the statement:
   local encrypt password

Press CTRL+enter to execute the statement or use the Execute button.

The password used to log on will be used by default. Replace it when necessary:

Press OK.

Enter password again.

Press OK.

The encrypted password is shown (note that the encrypted password is blurred although it is only usable on the device itself, just in case someone might get a hand on the device used for this picture):
Encryption with Invantive Data Hub

Perform the following steps to encrypt a password with the device key using Invantive Data Hub:

- Start Invantive Data Hub.
- Either log on to the database you want to encrypt the password for.
- Or choose one which does not require authentication like the Dummy database shown below:
Note that at (2) the user searches for a database with 'dummy' in the name and at (3) the user enters the number of the database given by the search.

At the INVANTIVE prompt enter the following statement and press enter:

```
local encrypt password
```

Enter the password and press enter.

Enter the password again and press enter:
Generate encrypted password

- The encrypted password will be shown.
- Optionally save the encrypted password to a file.

6 Exit Code

The exit code reflects whether execution was successful. The following exit codes are used:

- 0: Execution was completely successful.
- 1: Warning. A warning status indicates that something went wrong, but that the program completed correctly.
- 2: Error. An error status indicates an error raised by Invantive SQL or Data Hub.
- 3: Fatal. A fatal status means that an error occurred that was raised by code not maintained by Invantive, such as a file I/O error by Microsoft Windows.
- 4: Unhandled. An unhandled status means that the program was confronted with a situation it could not resolve. Please contact Invantive Support.

7 Invantive Script Extensions

Invantive Data Hub supports Invantive Script in addition to support for both Invantive SQL and native SQL databases. Invantive Script is executed on the device running the program.

The following statements are available on top of the regular Invantive Script statements:

- @@: run a SQL script file from the folder in which the current executing file is loaded.
- @: run a SQL script file from the working directory of the program.

8 Invantive Basics

8.1 Configuration

8.1.1 Customer Service

All Invantive products exchanges messages with a central Customer Service node. These messages include:

- error messages for analysis,
- usage statistics for billing.
On Invantive-internal development workstations only, a non-standard Customer Service node can be selected by specifying a deviating URL in the environment variable INVANTIVE_CS_BASE_URL.

8.1.2 OS Platform

A variety of Invantive products is available on Windows, Linux and Mac OSX. The list of supported platforms varies per product, depending on the availability of the libraries such as Microsoft .NET Core.

The OS platform is automatically determined by Invantive software, but sometimes can raise bugs given the bleeding edge nature of Microsoft .NET Core. It is possible to overrule the automatic detection of the OS platform by assigning a value to the environment variable INVANTIVE_FORCED_OS. The following values are supported:

- windows: Microsoft Windows,
- linux: Linux,
- osx: Mac OSX.

8.1.3 Startup Checks

The Invantive products execute a number of checks at application start to ensure that the environment running the software meets a number of pre-conditions as established by Invantive. These checks can be disabled for analysis purposes and out-of-the-ordinary deployment scenarios.

Support on products is only available when checks are not manually configured.

The following environment variables allow manual configuration of the checks by setting them to ‘true’ or ‘false’:

- INVANTIVE_CHECK_SYSTEM_COMPATIBILITY: validate system compatibility.
- INVANTIVE_MAINTAIN_VSTO: re-activate Invantive VSTO add-ins when disabled.
- INVANTIVE_CHECK_OS_UPDATES: validate OS updates have been applied sufficiently recent.

Configuration of checks is solely available on the Windows OS platform.

8.1.4 Cryptography

The Invantive products use cryptographic operations to protect:

- License key
- Invantive Keychain

By default, a key pair is used and stored in the profile of the user for encryption and decryption.

Windows

On Windows, the encryption is normally done using Windows-managed encryption protocols. The key elements are stored in the roaming profile of the current user.

In some deployment scenarios, a user has only a temporary Windows profile. In that case it is not possible to store a key pair. This is typically signaled by an itgenlic510 error code.
As an alternative, you can configure the environment variable `INVANTIVE_CRYPTOGRAPHY` to the value "MACHINE" to use a key pair that is stored solely on the device.

By setting the environment variable `INVANTIVE_RSA` to `INVANTIVE`, encryption on Windows is also managed as on other platforms by custom Invantive code at the expense of loss of some security features. Often Windows patches break the functionality of previously Windows-managed encryption keys, typically signaled by a error like "Key not valid for use in specified state". Switching to custom Invantive code will solve this problem.

**Linux, Mac OSX, Android, iPhone, Windows on Parallels**

On all other platforms, Invantive offers solely encryption using key elements stored in files in the RSA folder.

### 8.1.5 UI Language

The Invantive products supported approximately ten languages. On first startup, the language of the Windows version will be used when supported. Otherwise US-English is used.

The license decides which from the languages are supported.

Additionally, the user interface language chosen can further be restricted by setting the environment variable `INVANTIVE_ALLOWED_LANGUAGE_CODES` to a comma-separated list of two characters ISO 639-1 codes.

### 8.1.6 Folders

The Invantive products store configuration and runtime information in a folder hierarchy. This hierarchy is located within the Invantive folder of the user profile. It can be opened in Windows Explorer by entering `%USERPROFILE%\Invantive` in the location bar.

The location of the folder hierarchy can be changed using environment variables. The central location can be changed by setting the environment variable `INVANTIVE_CONFIGURATION_FOLDER` to a different folder.

A number of subfolders can be relocated too:

- `INVANTIVE_CONFIGURATION_BACKUP_FOLDER`: the folder with backups of settings files. Defaults to the master folder plus "Backup".
- `INVANTIVE_CONFIGURATION_CACHE_FOLDER`: the folder with disk cache files. Defaults to the master folder plus "Cache".
- `INVANTIVE_CONFIGURATION_HTTP_CACHE_FOLDER`: the folder with HTTP disk cache files. Defaults to the root cache folder plus "http" and the OS-user and front-end user.
- `INVANTIVE_CONFIGURATION_DATA_CACHE_CACHE_FOLDER`: the folder with Data Cache disk cache files. Defaults to the root cache folder plus "datacache". Disk cache files improve performance of HTTP downloads, but when necessary can be purged.
- `INVANTIVE_CONFIGURATION_LOG_FOLDER`: the folder with log files. Defaults to the master folder plus "Log".
- `INVANTIVE_CONFIGURATION_DATABASES_FOLDER`: the folder with databases files. Defaults to the master folder.
- `INVANTIVE_CONFIGURATION_PLUGINS_FOLDER`: the folder with plugin files. Defaults to the master folder plus "Plugins".
• INVANTIVE_CONFIGURATION_PROVIDERS_FOLDER: the folder with provider files. Defaults to the master folder plus "Providers".

• INVANTIVE_CONFIGURATION_RSA_FOLDER: the folder with RSA configuration files. Defaults to the master folder plus "RSA".

• INVANTIVE_CONFIGURATION_TEMPLATES_FOLDER: the folder with template files. Defaults to the master folder plus "Templates".

• INVANTIVE_CONFIGURATION_TRACE_FOLDER: the folder with trace files. Defaults to the master folder plus "Trace".

The values may contain any combination of the following placeholders which will be expanded:

• iiid: Invantive Installation ID.

• sessionid: Invantiv session ID.

• frontenduser: name of front-end user (when available).

• osuser: name of operating system user.

A folder can be configured for custom translations which overrule all default translations using the environment variable INVANTIVE_I18N_FOLDER.

9 Invantive SQL

One of the most familiar questions at our support desk is "what functions are available" in Invantive SQL to query data in Exact Online.

This second-generation SQL parser is an extensive implementation of many commonly found SQL constructs from the ANSI SQL standard.

It includes in addition to the features of the first-generation SQL parser also:

• joins,

• outer joins,

• cross joins,

• group functions such as stddev, avg and listagg,

• value functions such as xmlescape and round.

There are two flavors shipped:

• Free version: second-generation SQL parser without joins and some upcoming non-ANSI standard advanced mapping functions for large volume financial analysis and reporting.

• Paid version: identical to the free version but with joins and advanced mapping functions.

The EBNF-grammar in Grammar depicts the possibilities.

9.1 Language

9.1.1 Compatibility

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft
SQL Server. It is topped of with Invantive-specific extensions, especially for procedural SQL, distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few. The same holds for the procedural extension Invantive Procedural SQL, which reflects SQL/PSM and makes it easy to port Oracle PL/SQL or PostgreSQL PL/pgSQL statements.

9.1.2 Distributed SQL, Databases and Data Containers

It is easy to exchange and/or combine data across the supported platforms with data. To each platform (such as Salesforce or Exact Online Belgium) multiple connections can be active with the same or different platform-specific connection settings. Each open connection to a platform is named a 'data container'.

All opened connections together are named a 'database'.

When multiple data containers have been opened, each one has an alias to refer it by in Invantive SQL statements. For instance, a connection can be open for two different customer accounts on Exact Online Netherlands aliased as 'eolnl_comp1' and 'eolnl_comp55') and one for an Exact Online Belgium custom, aliased as 'eolbe_my_new_company'. The aliases can be freely chosen as long as they are valid identifiers and defined in the databases configuration file 'settings.xml'.

9.1.3 Service Providers

A number of special connections are always made, each of which can occur at most once. These are the 'service providers' such as:

- 'datadictionary': metadata of the current database, such as list of tables and executed SQL statements performance.
- 'os': information on the operating system running the SQL engine, such as reading file contents.
- 'smtp': synchronously send mails through SMTP.

9.1.4 Partitioning

Especially online platforms have a multi-tenant structure, in which the data is partitioned per customer, company or person. When the data model is identical across tenants, Invantive SQL considers them 'partitions'. SQL statements can run across multiple or one partitions, often in parallel. This enables consolidation scenarios across partitions (such as Exact Online or Nmbrs companies) as well as high-performance in MPP environments.

The partitions to be used can be specified with the 'use' statement, either through an explicit list of partitions to be selected across data containers, or through a SQL select statement returning the list of partitions to use. Please note that although the 'use' statement resembles the 'use DATABASE' statement on Microsoft SQL Server or PostgreSQL you can on Invantive SQL have multiple partitions active at the same time in one user session.

9.1.5 Identifiers

For identifiers, the regular conventions hold for the set of allowed characters. Depending on the platform, the identifiers are case sensitive or not. In general, it is best to assume that the identifier are case insensitive. There is no length limit on an identifier imposed by Invantive SQL.
9.1.6 Procedural SQL

Invantive Procedural SQL (or "PSQL" for short) is a procedural extension on top of Invantive SQL. It is based on the ISO-standard 9075-4:2016 (SQL/PSM) and extends Invantive SQL with procedural options like blocks, variables, conditional execution and loops. The procedural code is - together with the Invantive SQL contained - as a whole into pseudo-code and then executed.

The procedural code does not lean on the procedural options of the platforms being used, so it is easy to retrieve and change data in all supported cloud, file and database platforms. The pre-compiled procedural code does not perform context switches between procedural and SQL logic.

9.1.7 Licensing

The available functionality of Invantive SQL features is based upon the license features. For instance the free implementation of Invantive SQL is limited to 1.000 rows and no access to group functions. Please consult the data dictionary contents for your license features.

9.1.8 Settings.xml

The file settings.xml defines for a user or program the list of defined databases. Databases are grouped in ‘database groups’ for visual display. Database groups have no further functionality. Each database consists of one or multiple data containers.

The file 'settings.xml' is most often found on Microsoft Windows in your '%USERPROFILE%\invantive' folder, such as 'c:\users\john.doe\invantive\settings.xml'. It is shared across all Invantive SQL product installations for the user.

There are many scenarios to share database specifications across a user community, such as WAN-scenarios with Invantive Web Service, large corporate scenarios using DNS-entries as well as file shares, included files as well as single user solutions. Please involve a consultant when you want to deploy across thousands of users or more.

For user communities of up to 10 users, we recommend that company-specific settings are grouped per role in a separate file named 'settings-ROLE.xml' and placed in the default folder. Invantive SQL will automatically merge these files in the main settings.xml file.

9.1.9 Group Functions

The Invantive implementation of SQL is based upon ANSI SQL, extended by aspects from popular SQL implementations such as PostgreSQL, MySQL, Oracle, Teradata and Microsoft SQL Server. It is topped of with Invantive-specific extensions, especially for distributed SQL and distributed transactions. The basis is to implement functions such that as little as possible changes are necessary to run a SQL statement originating from another SQL implementation on Invantive SQL. For instance, to retrieve the current time you can use 'sysdate', 'now', 'getdate()' and 'sysdatetime' to name a few.

Popular group functions such as 'stddev' are available. However, currently you can not combine in one unnested SQL statement both group functions as well as expressions on the variables. In that case use an inner (nested) SQL statement to apply the expressions on the data, and execute the group functions in the outer SQL statement with the syntax 'select group() from ( select ... from ... )'.

9.1.10 Locking

An Invantive SQL statement can work with many traditional and online platforms. There are no locking features on data and objects, since few online and traditional platforms connected provide these and the typical use of distributed transactions leave even less opportunity for data and object locking.
9.1.11 Transactions

Invantive SQL has limited support for transactions. DML is forwarded to a platform and depending on the platform an error can cause part of the work to be registered or everything to be rolled back. Within the SQL engine, multiple changes can be collected and forwarded to the platform at once. For instance, when creating an EDIFACT message you need to combine an invoice header with invoice lines into one EDIFACT message. Collection of multiple changes is done using the 'identified by' and 'attach to' syntax, optionally preceded by 'begin transaction'.

9.1.12 Grammar

sqlBatch:

sqlOrPSqlStatement BATCHSEPARATOR BATCHSEPARATOR sqlBatch

no references

sqlOrPSqlStatement:

sqlStatement pSqlStatement

sqlOrPSqlStatement [15]

referenced by:

- sqlBatch [15]

sqlStatement:

An Invantive SQL can retrieve data from many traditional and online platforms. Many platforms also support the use of DML (Data Manipulation Language) statements to change the data contained. On a few platforms you can execute DDL (Data Definition Language) statements to create new data structure or objects such as tables, procedures or sequences.

sqlStatement [15]

referenced by:

- pSqlStatement [10]
- sqlOrPSqlStatement [15]
selectStatement:

A SQL select statement retrieves data from one or multiple data containers. A select statement can be composed of multiple data sets retrieved from many platforms, combined by set operators such as 'union'.

Often the performance of cloud platforms is less than traditional database platforms. With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'. An alternative for a 'limit' clause is to use the 'top' clause.

A sequence of Invantive SQL statements, separated by the semi-colon separator character.

Each statement in the SQL batch will be executed consecutively. Execution will be stopped when an error occurs during execution of a statement.

inSelectStatement:

A SQL select statement retrieves data from one or multiple data containers. This variant makes this data available to a containing SQL select statement. This feature is also known as an 'inline view'.

selectStatement

::= selectStatement

referenced by:

- predicateExpression

setOperatorSelectStatement:

SQL is based upon a solid mathematical foundation named 'set theory' with some exceptions. The set operators of Invantive SQL enable you to combine sets of data sets such as merging two sets of data. Please note that SQL actually uses 'bags', which opposed to 'sets', allow duplicates. To change bags of data into sets, either use 'distinct' or the 'union' set operator without 'all'. In general, the extensive use of 'distinct' signals bad database design.
The 'union' set operator returns the union of the data on the left and right side of the union while removing duplicate rows. The 'union all' set operator returns the union of the data on the left and right side of the union without removing duplicate rows. The 'minus' set operator returns all rows from the left side which do not occur in the right side. The 'intersect' set operator returns all rows that occur both in the left and right side.

executionHints:
```

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
Execution hints allow you to control individually the execution of SQL statements. Whenever possible, the hints will be used. In contrary to other platforms, Invantive SQL requires a hint to be valid according to the grammar when specified. This reduces the engineering risk that hints become invalid by accident.

EXECUTION_HINT_START joinSet noJoinSet ods resultSetName lowCost httpDiskCache
httpMemoryCache EXECUTION_HINT_END

evaluationHints
::= EXECUTION_HINT_START
( joinSet | noJoinSet | ods | resultSetName | lowCost | httpDiskCache | httpMemoryCache )* EXECUTION_HINT_END

referenced by:
- uniqueSelectStatement

**httpDiskCache:**

The http_disk_cache-hint specifies whether messages may be cached on disk when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the disk cache, the second parameter is a boolean whether data retrieved must be stored also in the disk cache and the third parameter is an integer that specifies the number of seconds before a disk cache hit found is to considered stale.

The use of the http_disk-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents of the disk cache are persistent across Invantive SQL sessions.

The disk cache is located in the Cache folder of the Invantive configuration folder.

HTTP_DISK_CACHE PARENTHESES_OPEN booleanConstant COMMA booleanConstant COMMA intervalConstant PARENTHESES_CLOSE

::= HTTP_DISK_CACHE ( PARENTHESES_OPEN booleanConstant ( COMMA booleanConstant ( COMMA intervalConstant )? )? )? PARENTHESES_CLOSE

referenced by:

**httpMemoryCache:**

The http_memory_cache-hint specifies whether messages may be cached in memory when the provider uses HTTP to exchange data with the backing platform. This typically holds only for cloud-based platforms such as Exact Online, Teamleader or Salesforce. The default setting is false. The first parameter is a boolean whether data may be taken from the memory cache, the second parameter is a boolean whether data retrieved must be stored also in the memory cache and the third parameter is an integer that specifies the number of seconds before a memory cache hit found is to considered stale.

The use of the http_memory-cache-hint is recommended for data which is known to change seldom such as seeded or reference data. The contents in the memory cache are forgotten across Invantive SQL sessions.
The memory cache is located in the Cache folder of the Invantive configuration folder.

- `executionHints`

ods:

The ods-hint controls the use of the Invantive Data Cache stored in a relational database. The Invantive Data Cache is also the basis of the Operational Data Store managed by Invantive Data Replicator and the data warehouses managed by Invantive Data Vault. The ods-hint specifies the maximum age data from the data cache eligible for use.

The boolean specifies whether the Data Cache may be used to answer a query. Set it to false to disable use of Data Cache for the duration of the query. Keep it on the default true to use Data Cache.

The interval specifies the period of time during which cached results are considered sufficiently fresh for use, such as '30 minutes'.

When no interval is present, the actual platform is consulted. The default with Invantive Data Cache enabled is to always use the data cache contents when not stale according to the metadata of the data cache. In general, that defaults to a maximum age of 7 days.

```

```
resultSetName ::= RESULT_SET_NAME ( PARENTHESES_OPEN stringConstant PARENTHESES_CLOSE )?
```

referred by:
- `executionHints`

joinSet:

Control join approach between two data sources. A column-indexed lookup will be used instead of a full table scan when the number of rows on the left-hand side does not exceed the maximum number of rows specified in the hint. When not specified, a hash lookup will only be used when the number of rows on the left-side does not exceed 5,000.
The actual implementation of a hash lookup depends on the platform on which the data container runs. For instance with OData, a number of requests will be made using an in-construct with a limited number of in-values. With a relation database platform, a native SQL 'in' will be used.

The first identifier is the alias of the table on the right-hand side of the join. The second identifier is the name of the column used to join upon in the right-hand side. The numeric constant specifies upto what number of rows on the left-hand side of the join will allow the join set hint to be used. When the number of rows exceeds the numeric constant, a full table join is made.

The following example takes for instances 5,000 sales invoices from an Exact Online environment with 100,000 sales invoices. Each sales invoice has 4..10 lines. The join does not retrieve all sales invoices nor all invoice lines, but instead fetches the 5,000 sales invoices using the where-clause, and then retrieves the related invoice lines using a column-indexed lookup by invoiceid. Since Exact Online is an OData source, the approximately 30,000 invoice lines will be retrieved in 300 session I/Os each having an in-construct for 100 lines on invoiceid.

```sql
select /*+ join_set(sil, invoiceid, 10000) */ * from ExactOnlineREST..SalesInvoices sik join ExactOnlineREST..SalesInvoiceLines sil on sil.invoiceid = sik.invoiceid where sik.status = 50 and sik.InvoiceDate between to_date( :P_RECEIPT_DATE_FROM , 'yyyymmdd') and to_date( :P_RECEIPT_DATE_TO, 'yyyymmdd')
```

**JOIN_SET**

```sql
JOIN_SET PARENTHESIS_OPEN identifier COMMA identifier COMMA numericConstant PARENTHESIS_CLOSE
```

Referenced by:
- **executionHints**

**noJoinSet**

The no_join_set hint disables the use of hash-joins. It can be enabled using the join_set hint.

```sql
NO_JOIN_SET PARENTHESIS_OPEN identifier COMMA identifier PARENTHESIS_CLOSE
```

Referenced by:
- **executionHints**

**variableList**

```sql
variableName COMMA variableName
```

Referenced by:
- **uniqueSelectStatement**
lowCost:
The low_cost-hint specifies that the select with the hint must be considered a select with low execution costs. Low execution costs trigger early evaluation during parsing. By default, select statements using solely in memory storage, dummy and data dictionary are considered low cost and evaluated early. The evaluation of all others is delayed as long as possible.

The use of the low_cost-hint is recommended when the select is used with a 'in ( select ... )' syntax and the developer knows beforehand that it will evaluate fast to values and that the use of these values will allow the use of server-side filtering for the outer select.

\[
\text{LOW\_COST} \quad \text{lowCost} \quad ::= \quad \text{LOW\_COST}
\]

referred by:

- executionHints

distinct:
Addition of the 'distinct' keyword to a SQL select statement de-duplicates the rows returned. Rows are considered duplicates when the values in all selected columns are identical, with two null-values considered equal.

\[
\text{DISTINCT} \quad \text{distinct} \quad ::= \quad \text{DISTINCT}
\]

referred by:

- aggregateFunction
- uniqueSelectStatement

topClause:
With the 'top' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'.

\[
\text{TOP} \quad \text{numericConstant} \quad ::= \quad \text{TOP} \quad \text{numericConstant}
\]

referred by:

- uniqueSelectStatement

limitClause:
With the 'limit' clause a limited number of rows can be retrieved quickly from a table or view after applying sorting as specified by the possibly present 'order by'.

\[
\text{LIMIT} \quad \text{numericConstant} \quad ::= \quad \text{LIMIT} \quad \text{numericConstant}
\]

referred by:

- selectStatement
embeddedSelect:

An embedded select, also known as an 'inline view', retrieves rows using the specified select statement. These rows are consumed by the outer select as were it the results of retrieving the rows from a table.

Invantive SQL does not allow grouping rows with expressions as columns. An embedded select is typically used to evaluate expressions to rows with solely constants. After applying the embedded select the group operators can be applied.

```sql
parenthesisOpen selectStatement parenthesisClose
   embeddedSelect ::= parenthesisOpen selectStatement parenthesisClose
```

- `dataSource`

---

tableSpec:

A table specification without parameters. The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

A number of special so-called 'service providers' are always present, such as 'datadictionary' for use by an alias.

```sql
fullTableIdentifier distributedAliasDirective
tableSpec ::= fullTableIdentifier distributedAliasDirective
```

- `alterPersistentCacheSetTableOptions`
- `alterPersistentCacheTableRefreshStatement`
- `createTableStatement`
- `deleteStatement`
- `dropTableStatement`
- `insertStatement`
- `updateStatement`

---

tableOrFunctionSpec:

A table specification requiring a comma-separated list of parameters to determine the rows to be retrieved.

Traditional SQL syntax did not provide for parameterized queries, matching set theory. Modern variants such as pipelined table functions allow a stored procedure or other imperative language-based approaches to generate rows based upon parameter values. Many data containers support queries that returns rows based upon parameter values. This holds especially for SOAP web services. Table specifications with parameters ease queries on such data containers.
The optional alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

```
fullTableIdentifier tableFunctionSpec distributedAliasDirective
tableOrFunctionSpec ::= fullTableIdentifier tableFunctionSpec distributedAliasDirective
```

**tableFunctionSpec**:

A comma-separated list of parameters to determine the rows to be retrieved by a tableOrFunctionSpec.

```
parenthesisOpen expression COMMA parenthesisClose
tableFunctionSpec ::= parenthesisOpen ( expression ( COMMA expression )* ) parenthesisClose
```

referenced by:
- `tableOrFunctionSpec`

**distributedAliasDirective**:

The distributed alias after the at-sign specifies a specific data source to be used, such as 'exactonlinerest..journals@eolbe' specifying the use of Exact Online Belgium when 'eolbe' is associated by the database definitions in settings.xml with Exact Online Belgium.

A number of special so-called 'service providers' are always present, such as 'datadictionary' for use by an alias.

```
AT dataContainerAlias distributedAliasDirective
distributedAliasDirective ::= AT dataContainerAlias
```

referenced by:
- `partitionIdentifierWithAlias`
- `setIdentifier`
- `tableOrFunctionSpec`
- `tableSpec`

**dataContainerAlias**:

When multiple data containers have been defined in settings.xml for a database, each one is assigned an alias. An alias typically takes the form of a limited number of characters. The presence of an alias allows Invantive SQL to precisely determine to what data container forward a request for data.

column:
A column is identified by an identifier, possibly prefixed by the name of the table or the alias of the table from which the column is to be taken.

```
column ::= identifier ( DOT identifier )?
```

referenced by:
- `columnList`
- `orderBy`
- `updateValue`

whereClause:
The where-clause restricts the number of rows in a result set by applying one or more boolean conditions which rows must satisfy.

```
whereClause ::= WHERE booleanExpression
```

referenced by:
- `deleteStatement`
- `uniqueSelectStatement`
- `updateStatement`

joinStatements:
A list of join statement.

```
joinStatement
  ::= joinStatements | joinStatement
```

referenced by:
- `uniqueSelectStatement`

**joinStatement:**

A join statement combines two result sets. Only combinations of rows taken from both result sets are returned when they meet the join conditions.

```
joinStatement
  ::= joinCategory join dataSource joinConditions
```

referenced by:
- `joinStatements`

**joinCategory:**

The join category specifies what combinations of rows are considered. The following variants can be used:

- inner join, as indicated by 'join' or 'inner join': an inner join returns all combinations of rows from both result sets that meet the join conditions.
- left outer, as indicated by 'left outer join': a left outer join returns the same rows as an inner join, extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- right outer, as indicated by 'right outer join': a right outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. Each column that originates from the left result set is assigned a null value.
- full outer, as indicated by 'full outer join': a full outer join returns the same rows as an inner join, extended by one row for each row in the right result set having no matching rows in the left result set. The results are also extended by one row for each row in the left result set having no matching rows in the right result set. Each column that originates from the right result set is assigned a null value.
- cross join, as indicated by 'cross join': a cross join returns a Cartesian product of the rows from both result sets. A 'Cartesian product' is a term from set theory, which indicates that all combinations are returned.

```
joinCategory
  ::= ( inner | joinSubCategory outer | cross )?
```

referenced by:

**alterPersistentCacheStatement:**

Besides an in-memory cache valid during the duration of a session, Invantive SQL offers an integrated cache storing data persistently using an on-premise or cloud relation database such as SQL Server or PostgreSQL. When configured, Invantive SQL first tries to find sufficiently fresh data in the cache. This reduces the number of data loads from slow data containers such as some cloud platforms. In general, the performance increase when the rows can be fully retrieved from a cache is between a factor 25 and 2,500.

Invantive SQL itself manages the table structure and table contents in the relation database used as a data cache. On initial use just provide an empty database. Invantive SQL installs a repository consisting of a few tables. The repository tables have names starting with 'dc_'.

For each table partition version, a so-called facts table is created. A facts table contains a full copy of the rows retrieved from the data container. Facts tables have names starting with 'dcd_', followed by a unique hash signaling the table partition version. When necessary, additional database objects are maintained such as indexes to improve performance. As with facts table names, all column names are also hashed based upon an algorithm including the original column name. These facts tables are not intended for direct use using native SQL.

Each facts table has a unique state from the following state, with Ready state signaling the now current version:
- Initializing ('I'): the facts table will be created.
- View creation ('V'): logical views will be created.
- Prepared ('P'): the facts table has been created, but contains yet no rows.
- Seeding ('S'): the facts table is being seeded with the contents of the previously current version.
- Loading ('L'): loading new facts from data container using water shed or another algorithm.
- Ready ('R'): the facts table is available and the current one to be used.
- Obsoleted ('O'): the facts table still exists, but the data has passed it's conservation period. Often a newer version is now current.
- Dropped ('D'): the facts table now longer exist, but the metadata is still present in the repository tables.

The persistent cache in the database can be used with native SQL when extended by Invantive Data Replicator. Invantive Data Replicator can create and maintain a database view (a so-called 'partition view') for the now current version of table partition. Similarly, it can create an 'overall view', showing the rows across all partitions of the now current versions per partition.

The overall views are typically used for consolidation purposes, bringing together data across multiple companies or persons.

beginTransactionStatement:
A begin transaction statement initiates a transaction. Invantive SQL typically provides no transaction logic given the distributed nature and the limitations of the possible platforms. Some platforms enable collection of transaction data, which are to be handed over to the backing platform all together.

```
BEGIN TRANSACTION
```

referenced by:
* transactionStatement

rollbackTransactionStatement:
Forgets all collected transaction data not yet handed over to the backing platform.

```
ROLLBACK TRANSACTION
```

referenced by:
* transactionStatement

commitTransactionStatement:
Hand over all collected transaction to the backing platform for registration.

```
COMMIT TRANSACTION
```

referenced by:
* transactionStatement

useStatement:
The use statement enables you to specify which partitions should be accessed by subsequent select, insert, update and delete statements. You can specify one or multiple partitions as a comma-separated list, possibly for a specific data container by appending an at-sign plus data container alias to the partition code. The value 'default' has a special meaning; it specifies to use the partition(s) originally selected when you logged on. The value 'all' also has a special meaning: it selects all partitions available.

For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use 35@eolnl, 57345@nmbrsnl'.

For complex scenarios, you can specify any valid Invantive SQL select statement which returns one or two columns. Each row from the query specifies one partition to select. The first column specifies the partition code, whereas the optional second column specifies a specific data container alias.
For instance, to select partition '35' in the data container with alias 'eolnl' and partition '57345' in the data container with alias 'nmbrsnl', you can execute: 'use select '35', 'eolnl' from dual@datadictionary union all select '57345', 'nmbrsnl' from dual@datadictionary'.

demanded by:

• arithmeticExpression

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
abs:
Returns the absolute value of a double-precision floating-point number.

Parameters:
- Input: A number that is greater than or equal to System.Double.MinValue, but less than or equal to System.Double.MaxValue.

Returns: A double-precision floating-point number. ABS

\[
abs \ ::= \text{ABS}
\]

referenced by:
- functionExpression

acos:
Returns the angle of the provided cosine.

Parameters:
- Input: the cosine to get the angle of.

Returns: A number which represents the angle of the provided cosine. ACOS

\[
acos \ ::= \text{ACOS}
\]

referenced by:
- functionExpression

anonymize:
Anonymize a text or number. Anonymization is executed such that when the same original value is anonymized within the same session, the anonymized value will be identical. The anonymized value also uniquely matches the original value. With no access to the anonymization map however, the original value can however not be calculated from the anonymized value.

In mathematics, the anonymization function is a bijection: each element of the original set is paired with exactly one element of the anonymized set, and each element of the anonymized set is paired with exactly one element of the original set.

Parameters:
- Value: A text or number to be obfuscated.
- Maximum length (optional): Maximum length in digits for numbers or characters for text of anonymized value. Null means no restriction on maximum length.
- Mapping (optional): algorithm to use. The default algorithm is 'DEFAULT' which maps text values to a range of hexadecimal characters and numbers to a range of numbers. Alternative mappings are described below.

The following anonymization maps are available on installation:
- DEFAULT: the default algorithm.
- IVE-GL-JOURNAL-DESCRIPTION: general ledger journal descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
- IVE-GL-ACCOUNT-DESCRIPTION: general ledger account descriptions: no preferred anonymizations, leave familiar and non-confidential descriptions in original state.
- IVE-PSN-FIRST-NAME: person first names: prefer readable alternative first names, anonymize all.
- IVE-PSN-LAST-NAME: person last names: prefer readable alternative last names, anonymize all.
- IVE-ADS-CITY-NAME: address city names: prefer readable alternative city names, anonymize all.
- IVE-ADS-STREET-NAME: address street names: prefer readable alternative street names, anonymize all.

The data dictionary contains the anonymization maps used so far in the session and their corresponding values:

```sql
select * from SystemAnonymizationMaps@DataDictionary
select * from SystemAnonymizationMapValues@DataDictionary
select * from SystemAnonymizationPredefinedMaps@DataDictionary
```

Returns: Anonymized value. ANONYMIZE

```sql
anonymize ::= ANONYMIZE
```

referenced by:
- `functionExpression`

ascii:

Get the position of a character on database character set.

Parameters:
- Input: character to get position from.

Returns: The position of the character on database character set. ASCII

```sql
ascii ::= ASCII
```

referenced by:
- `functionExpression`

asin:

Returns the angle of the provided sine.

Parameters:
- Input: the sine to get the angle of.

Returns: A number which represents the angle of the provided sine. ASIN

```sql
asin ::= ASIN
```

referenced by:
- `functionExpression`

atan:

Returns the angle of the provided tangent.
Parameters:
- Input: the tangent to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN

\[ \text{atan} \] := \text{ATAN} \]

referenced by:
- functionExpression

atan2:

Returns the angle of the provided tangent.

Parameters:
- First number: the first number to get the angle of.
- Second number: the second to get the angle of.

Returns: A number which represents the angle of the provided tangent. ATAN2

\[ \text{atan2} \] := \text{ATAN2} \]

referenced by:
- functionExpression

add_months:

Add an amount of months to a datetime.

Parameters:
- Date: datetime to assim the months to.
- Months: the amount of months to add.

Returns: A new datetime with the amount of months added. ADD_MONTHS

\[ \text{add\_months} \] := \text{ADD\_MONTHS} \]

referenced by:
- functionExpression

base64_decode:

Converts the base64_encoded value back to the binary value as defined on Wikipedia.

Parameters:
- Input: value to convert back to the original.

Returns: The input decoded back to the binary value. BASE64_DECODE

\[ \text{base64\_decode} \] := \text{BASE64\_DECODE} \]

referenced by:
- functionExpression

base64_encode:
Converts a binary value to base64-encoded characters as defined on Wikipedia.

Parameters:
- Input: value to convert to base64 characters.

Returns: The input encoded to base64 characters. BASE64_ENCODE

```
base64_encode ::= BASE64_ENCODE
```

Referenced by:
- `functionExpression`[^60]

camel:

Converts provided string to Camel case.

Parameters:
- Input: the string that will be converted to Camel case.

Returns: A string converted to Camel case. CAMEL

```
camel ::= CAMEL
```

Referenced by:
- `functionExpression`[^60]

ceil:

Rounds the input to the largest following integer. Unless an amount of decimals is defined, in which case it rounds to the largest integer number with the amount of decimals or date with the amount of positions.

Parameters:
- Input: A number or datetime to ceil.
- Decimals [optional]: A number to specify how many decimals it may ceil to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The ceiling of the input. CEIL

```
ceil ::= CEIL
```

Referenced by:
- `functionExpression`[^60]

chr:

Get a character from database character set.

Parameters:
- Input: a numeric value of a character.

Returns: A character from the database character set. CHR CHAR

```
chr ::= CHR
```

Referenced by:
- `functionExpression`[^60]
• functionExpression

bit_length:
Get the number of bits needed to represent a value. For a blob, this is the number of bits for the bytes of the blob. For all other data types, the value is first converted to a string and then the number of bits of the UTF8 representation is determined.

Parameters:
• Value: value to determine length in bits for.

Returns: number of bits needed to represent the value. BIT_LENGTH

bit_length ::= BIT_LENGTH

referenced by:
• functionExpression

octet_length:
Get the number of bytes needed to represent a value. For a blob, this is the number of bytes of the blob. For all other data types, the value is first converted to a string and then the number of bytes of the UTF8 representation is determined.

Parameters:
• Value: value to determine length in bytes for.

Returns: number of bytes needed to represent the value. OCTET_LENGTH

octet_length ::= OCTET_LENGTH

referenced by:
• functionExpression

repeat:
Get a concatenation of the text by a number of times.

Parameters:
• Text: text to repeat.
• Times: number of time to repeat the text.

Returns: the text repeated a number of times. REPEAT

repeat ::= REPEAT

referenced by:
• functionExpression

raise_error:

RAISE_ERROR

referenced by:
coalesce:
Performs a coalescing operation.
Parameters:
- Left: an object.
- Right: an object.
Returns: the left value if right is empty, otherwise the right value. COALESCE

\[
\text{coalesce} ::= \text{COALESCE}
\]

concat:
Concatenate the left and right values together as a text.

\[
\text{concat} ::= \text{CONCAT}\_\text{OP}
\]

concat_func:
Concatenate a list of values together as a text.

\[
\text{concat\_func} ::= \text{CONCAT}
\]

cos:
Returns the cosine of the provided angle.
Parameters:
- Input: the angle to get the cosine of.
Returns: A number which represents the cosine of the provided angle. COS

\[
\text{cos} ::= \text{COS}
\]
COVFEFIFY

\[
\text{covfefify}^{62} ::= \text{COVFEFIFY}^{62}

dateadd:

Adds an amount of time to a date.

Parameters:
- Interval: the date interval to be added.
- Number: the number of intervals to add.
- Date: the date to which the interval should be added.

Returns: The original date with the number of intervals added. DATEADD

\[
\text{dateadd}^{63} ::= \text{DATEADD}^{63}
\]

referenced by:
- \(\text{functionExpression}^{63}\)

datepart:

Get the specified datepart from a datetime.

Parameters:
- datepart: a part of a date.
- date: a datetime to get the datepart from.

Returns: a part of a datetime. DATEPART

\[
\text{datepart}^{63} ::= \text{DATEPART}^{63}
\]

referenced by:

day:
Collect the day from a date.
Parameters:
  \bullet Input: A dateTime.

Returns: The day as an integer. DAY
   \texttt{day[64]} \\
   ::= \texttt{DAY[64]}

referenced by:
   \bullet \texttt{functionExpression[56]}

dayofweek:
Collect the day of a week from a date.

Parameters:
  - Input: A DateTime.

Returns: The day of a week as an integer. DAYOFWEEK
dayofweek\[64\]
  ::= DAYOFWEEK\[64\]

referenced by:
  - functionExpression\[56\]

**DayOfYear**:

Collect the day of a year from a date.

Parameters:
  - Input: A DateTime.

Returns: The day of a year as an integer. DAYOFYEAR
dayofyear\[65\]
  ::= DAYOFYEAR\[65\]

referenced by:
  - functionExpression\[56\]

**Dense_Rank**:

DENSE_RANK
dense_rank\[65\]
  ::= DENSE_RANK\[65\]

  - functionExpression\[56\]

(C) Copyright 2004-2020 Invantive Software B.V., the Netherlands. All rights reserved.
divide:
Divide one number by the second number.
Parameters:
- first: a number to divide.
- second: a number to divide with.
Returns: the divided output. DIVIDE
\[
\text{divide} \quad ::= \quad \text{DIVIDE}
\]

exp:
Returns the provided number raised to the specified power.
Parameters:
- Input: the number to raise by the specified power.
Returns: A number which is the provided number raised to the specified power. EXP_OP
\[
\text{exp} \quad ::= \quad \text{EXP_OP}
\]

floor:
Rounds the input to the smallest following integer. Unless an amount of decimals is defined, in which case it rounds to the smallest integer with the amount of decimals or date with the amount of positions.
Parameters:
- Input: A number or datetime to floor.
  - Decimals [optional]: A number to specify how many decimals it may floor to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.
Returns: The floor of the input. FLOOR
\[
\text{floor} \quad ::= \quad \text{FLOOR}
\]
from_unixtime:
Get the date/time from an integer representing a UNIX epoch time.

Parameters:
- Input: An integer.

Returns: The date/time which the UNIX epoch time represents. FROM_UNIXTIME

```sql
from_unixtime ::= FROM_UNIXTIME
```

referenced by:
- `functionExpression`

hour:
Collect the hour from a date.

Parameters:
- Input: A dateTime.

Returns: The hour as an integer. HOUR

```sql
hour ::= HOUR
```

referenced by:
- `functionExpression`

initcap:
Changes the first letter of each word in uppercase, all other letters in lowercase.

Parameters:
- Input: Text to convert.

Returns: The input with the first letter of each word in uppercase. INITCAP

```sql
initcap ::= INITCAP
```

referenced by:
- `functionExpression`

instr:
Get a number which is a position of the first occurrence of substring in the string.

Parameters:
- String: String to be searched.
- Substring: Text to search for.
- StartPosition [optional]: Position of string to start searching.
- occurrence [optional]: Return the position of the occurrence.

Returns: The position of the substring inside the original string. INSTR

```sql
instr ::= INSTR
```

referenced by:
- `functionExpression`
jsondecode:

\[
\text{JSONDECODE} \;

jsonencode:

\[
\text{JSONENCODE} \;
\]

::= \text{JSONENCODE}

referenced by:

• \text{functionExpression}

length:

Gets the number of characters in provided string.

Parameters:

• Input: the string to get the length of.

Returns: A number which represents the number of characters in the provided string.

\[
\text{LENGTH} \;
\]

::= \text{LENGTH}

referenced by:

• \text{functionExpression}

levenshtein:

Determine the Levenshtein distance between two values as defined on Wikipedia.

\[
\text{LEVENSHTEIN} \;
\]

::= \text{LEVENSHTEIN}

referenced by:

• \text{functionExpression}

list:

\[
\text{COMMA} \;
\]

::= \text{COMMA}

referenced by:

ln:
Get the natural logarithm of a number.
Parameters:
  - Input: a number to get the natural logarithm from.
Returns: The natural logarithm of the input. LN

\[
\text{ln} ::= \text{LN}
\]

log:
Get the natural logarithm of a number in a specified base.
Parameters:
  - Input: a number to get the natural logarithm from.
  - Base [optional]: the base to get the natural logarithm from.
Returns: The natural logarithm of the input in the specified base. LOG

\[
\text{log} ::= \text{LOG}
\]

lower:
Converts provided string to lowercase.
Parameters:
  - Input: the string that will be converted to lowercase.
Returns: A string converted to lowercase. LOWER

\[
\text{lower} ::= \text{LOWER}
\]

lpad:
Pad a string to the left to make it a specified length.
Parameters:
  - Input: string to be padded.
  - Length: the length the string should be padded to.
  - Characters [optional]: Characters to pad with.
Returns: A string padded to the left to a given length with the optional specified characters. LPAD

\[
\text{lpad} ::= \text{LPAD}
\]
**ltrim:**

Trims characters from the left side of a string.

Parameters:
- **Input:** the string from to trim characters from the left side.
- **(Optional)** Chars to trim: the character to trim. Default is " ".

Returns: A string with chars trimmed from the left. LTRIM

\[
\text{ltrim} \equiv \text{LTRIM}
\]

referred by:
- [functionExpression](#)

**md5:**

Converts a value to a 128-bit hash value as defined on [Wikipedia](#).

Parameters:
- **Input:** Text to convert with MD5.

Returns: The input converted with MD5. MD5

\[
\text{md5} \equiv \text{MD5}
\]

referred by:
- [functionExpression](#)

**metaphone:**

Converts a value to the Metaphone code as defined on [Wikipedia](#).

Parameters:
- **Input:** value to convert to metaphone.
- **Length:** maximum output length of the given input.

Returns: The input converted to metaphone, with a given output length. METAPHONE

\[
\text{metaphone} \equiv \text{METAPHONE}
\]

referred by:
- [functionExpression](#)

**metaphone3:**

METAPHONE3

\[
\text{metaphone3} \equiv \text{METAPHONE3}
\]

referred by:
- [functionExpression](#)
metaphone3_alt:
METAPHONE3_ALT
  metaphone3_alt[71] ::= METAPHONE3_ALT[71]

mod:
Get the remainder of a divide calculation.
Parameters:
  - dividend: a number.
  - divider: a number.
Returns: The remainder. MOD
  mod[71] ::= MOD[71]

minus:
Subtracts a value from another.
Parameters:
  - Value: a number or datetime.
  - Subtract: a number or datetime.
Returns: The value minus the subtraction. MINUS
  minus[71] ::= MINUS[71]

minute:
Collect the minute from a date.
Parameters:
  - Input: A dateTime.
Returns: The minute as an integer. MINUTE
  minute[71] ::= MINUTE[71]
Parameters:
- Input: A date\text{Time}.

Returns: The month as an integer. \text{MONTH}

\text{month}::= \text{MONTH}

referred by:
- \text{functionExpression}

\text{newid}:

Creates a new \text{Guid id}.

Returns: The new \text{Guid id}.

\text{NEWID}

\text{newid}::= \text{NEWID}

referred by:
- \text{functionExpression}

\text{nvl}:

Coalesce all values together.

Returns: All values coalesced together.

\text{NVL}

\text{nvl}::= \text{NVL}

referred by:
- \text{functionExpression}

\text{plus}:

Adding a value to another.

Parameters:
- Value: a number or \text{datetime}.
- add: a number or \text{datetime}.

Returns: A new value with both values added to each other. \text{PLUS}

\text{plus}::= \text{PLUS}

referred by:
- \text{arithmeticExpression}

\text{power}:

Gets a value of a number raised to another.

Parameters:
- Value: a number.
- exponent: a number.
Returns: The value of a number raised to another. POWER

\[
\text{power} := \text{POWER}
\]

referenced by:

- functionExpression

random:
Generates a random number between 0 and 1.

Parameters:

- Seed: Produce a repeatable sequence of random numbers each time that seed value is provided.

Returns: A random number between 0 and 1. RANDOM

\[
\text{random} := \text{RANDOM}
\]

referenced by:

- functionExpression

random_blob:
Generates a blob with pseudo-random values.

Parameters:

- Length: Produce a blob with this length in terms of bytes.

Returns: A blob with pseudo-random values. RANDOM_BLOB

\[
\text{random_blob} := \text{RANDOM_BLOB}
\]

referenced by:

- functionExpression

rand:

RAND

\[
\text{rand} := \text{RAND}
\]

referenced by:

- functionExpression

rank:

RANK

\[
\text{rank} := \text{RANK}
\]

referenced by:

- functionExpression

regexp_substr:
Extracts a substring from the given value using regular expression.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the substr operation.
- Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The substring from the input. REGEXP_SUBSTR

```
regexp_substr ::= REGEXP_SUBSTR
```

referred by:
- functionExpression

regexp_instr:
Determine the position of the regular expression in the given value. Returns 0 when the regular expression is not contained in the given value.

Parameters:
- Input: The text to get the regular expression position from.
- Pattern: Regular expression pattern.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the instr operation.
- ReturnOption [optional]: Select either the first character found or the first character after the occurrence of the pattern.
- Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function.

Returns: The location of a regular expression pattern in the input. REGEXP_INSTR

```
regexp_instr ::= REGEXP_INSTR
```

referred by:
- functionExpression

regexp_replace:
Replaces all occurrences matching the regular expression with the replacement value. The replacement value may contain references to matches in the regular expression by using the dollar-sign ('$') plus the reference number.

Parameters:
- Input: The text to get the substring from.
- Pattern: Regular expression pattern.
- Replacement [optional]: Text to replace with.
- Start position [optional]: The start index from the input.
- Appearance [optional]: Indicating the appearance of the replace operation.
• Match_parameter [optional]: A text literal that lets you change the default matching behavior of the function. The available options are 'c' for case-sensitive, 'i' for ignore case, 'n' for single-line, 'm' for multi-line and 'x' for ignore pattern white space.

Returns: The input with every occurrence of the regular expression pattern replaced with the replacement.

\[
\text{REGEXP_REPLACE} \quad \text{regexp_replace} \quad ::= \text{REGEXP_REPLACE}
\]

reflected by:
• functionExpression

remainder:
Get the remainder of a divide calculation.

The REMAINDER function uses the round function in its formula, whereas the MOD function uses the floor function in its formula.

Parameters:
• Number1: a number.
• Number2: a number.

Returns: The remainder. REMAINDER

\[
\text{remainder} \quad ::= \text{REMAINDER}
\]

reflected by:
• functionExpression

replace:
Replaces a string with string in given string.

Parameters:
• Input: the string to replace a string in.
• Old text: the string to be replaced.
• New text: the string which 'Old text' will be replaced with.

Returns: A string with the replaced string. REPLACE

\[
\text{replace} \quad ::= \text{REPLACE}
\]

reflected by:
• functionExpression

reverse:
Flips the input around.

Parameters:
• Input: text to flip around.

Returns: The text with it's characters in reversed order. REVERSE
reverse ::= REVERSE

referenced by:
  - functionExpression

round:
Rounds the input to the closest following integer. Unless an amount of decimals is defined, in which case it rounds to the closest integer number with the amount of decimals or date with the amount of positions.

Parameters:
  - Input: A number or datetime to round.
  - Decimals [optional]: A number to specify how many decimals it may round to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The rounded input. ROUND
  round ::= ROUND

referenced by:
  - functionExpression

row_number:
ROW_NUMBER
  row_number ::= ROW_NUMBER

referenced by:
  - functionExpression

rpad:
Rightpad function pads the right-side of a string with a specific set of characters to the given length. When no set of characters given, it will pad with a whitespace.

Parameters:
  - Input: Text to be padded.
  - Length: The length to make the input to.
  - Pad text [optional]: Text to add to the input if the length is larger then the input.

Returns: The padded text, or null if the string cannot be padded. RPAD
  rpad ::= RPAD

referenced by:
  - functionExpression

rtrim:
Trims characters from the right side of a string.

Parameters:
- Input: the string from which to trim characters from the right side.
- (Optional) Char to trim: the character to trim. Default is " ".

Returns: A string with chars trimmed from the right. RTRIM

\[
\text{rtrim} ::= \text{RTRIM}
\]

Referenced by:
- `functionExpression`

**microsecond:**

Collect the microsecond from a date.

Parameters:
- Input: A dateTime.

Returns: The microsecond as an integer. MICROSECOND

\[
\text{microsecond} ::= \text{MICROSECOND}
\]

Referenced by:
- `functionExpression`

**millisecond:**

Collect the millisecond from a date.

Parameters:
- Input: A dateTime.

Returns: The millisecond as an integer. MILLISECOND

\[
\text{millisecond} ::= \text{MILLISECOND}
\]

Referenced by:
- `functionExpression`

**number_to_speech:**

NUMBER_TO_SPEECH

\[
\text{number to speech} ::= \text{NUMBER TO SPEECH}
\]

Referenced by:
- `functionExpression`

**normalize:**

Normalize a file path by replacing all invalid and non-ASCII characters for use in a file path by underscore. After that, the file path is made more readable by various operations such as removal of duplicate whitespace and underscore characters.

Parameters:
- Original file path: path of the file.
- Maximum file name length: length in characters into which the normalized file name must fit.
- Allow path separator: whether to allow the path separator \\ in the normalized file name. When not, occurrences are replaced.

Returns: a normalized file path. NORMALIZE

\[
\text{normalize} : = \text{NORMALIZE}
\]

referenced by:
- functionExpression

second:
Collect the second from a date.
Parameters:
- Input: A dateTime.

Returns: The second as an integer. SECOND

\[
\text{second} : = \text{SECOND}
\]

referenced by:
- functionExpression

soundex:
Converts a value to the Soundex code as defined on Wikipedia.
Parameters:
- Input: Text to that retrieve the soundex value from.

Returns: A text started with a number and followed by 3 digits. SOUNDEX

\[
\text{soundex} : = \text{SOUNDEX}
\]

referenced by:
- functionExpression

sin:
Returns the sine of the provided angle.
Parameters:
- Input: the angle to get the sine of.

Returns: A number which represents the sine of the provided angle. SIN

\[
\sin : = \text{SIN}
\]

referenced by:
- functionExpression

sqrt:
Returns the square root of the provided number.
Parameters:

- **Input:** the number to get the square root of.

Returns: A number which represents the square root of the provided number. SQRT

\[
\text{sqrt} \ ::= \ 	ext{SQRT}
\]

referenced by:

- **functionExpression**

**substr:**

Gets a substring from the input.

Parameters:

- **Input:** text to gather the substring from.
- **Start:** start position.
- **Length:** maximum length of the substring.

Returns: The substring from the original input. SUBSTR

\[
\text{substr} \ ::= \ 	ext{SUBSTR}
\]

referenced by:

- **functionExpression**

**sys_context:**

Text value of a parameter associated with a context.

Parameters:

- **context:** a namespace.
- **parameter:** name of the parameter.

Solely the namespace USERENV is available with the following parameter names:

- **APPLICATION_VERSION**: version of the client application.
- **APPLICATION_FULL**: name and version of the client application.
- **APPLICATION_BUILD_EXPIRATION_DATE**: build expiration date of the client application.
- **AUTHENTICATION_METHOD**: current authentication method.
- **CLIENT_IP_ADDRESS_INTERNAL**: internal IP address of the client device.
- **CLIENT_IP_ADDRESS_EXTERNAL**: external IP address of the client device.
- **CLIENT_LOGICAL_CORE_COUNT**: number of logical processor cores in the client device.
- **CLIENT_MACHINE_NAME**: machine name of the client device.
- **CLIENT_SYSTEM_64_BIT**: whether the OS is 64-bit on the client device.
- **CLIENT_SYSTEM_NAME**: full OS name running on the client device.
- **CLIENT_SYSTEM_DIRECTORY**: system directory of the client device.
- **CLIENT_SYSTEM_PAGE_SIZE**: system page size of the client device.
- **CLIENT_VIRTUAL_MACHINE**: whether the client device is a virtual machine.
- **CLR_VERSION_BUILD**: build version of the Common Language Runtime.
- **CLR_VERSION_MAJOR**: major version of the Common Language Runtime.
- **CLR_VERSION_MAJOR_REVISION**: major revision of the Common Language Runtime.
- CLR_VERSION_MINOR: minor version of the Common Language Runtime.
- CLR_VERSION_MIN_REVISION: minor revision of the Common Language Runtime.
- COMPANY_ID: ID of the company of current user.
- COMPANY_NAME: name of the company of current user.
- COMPANY_PHONE: phone of the company of current user.
- COMPANY_WEB_SITE: web site of the company of current user.
- DATA_CONTAINER_ALIAS: alias of active data container.
- DATA_CONTAINER_ID: ID of active data container.
- DATABASE_DESCRIPTION: description of database.
- DATABASE_FULL_NAME: full name of database.
- DATABASE_VERSION: version of database.
- LANG: ISO abbreviation for the language name of the user. Alternative: USER_LANGUAGE_CODE.
- MODULE: name of the client application. Alternative: APPLICATION_NAME.
- PROCESS_64_BIT: whether the OS process on the client device runs as 64-bit.
- PROCESS_COMMAND_LINE: command line used to start the OS process.
- PROCESS_CURRENT_DIRECTORY: current directory of the OS process.
- PROCESS_STACK_TRACE: current stack trace of the OS process.
- PROCESS_WORKING_SET: working set of the OS process.
- PROVIDER_DESCRIPTION: description of active data container.
- PROVIDER_DOCUMENTATION_URL: documentation (URL) of active data container.
- PROVIDER_DOWNLOAD_IMPLEMENTATION_URL: download driver (URL) of active data container.
- PROVIDER_NAME: name of active data container.
- PROVIDER_SHORT_NAME: short name of active data container.
- PROVIDER_TECHNICAL_DOCUMENTATION_URL: technical documentation (URL) of active data container.
- SESSION_USER: log on code of the current user. Alternative: CURRENT_USER.
- SESSIONID: session ID of current session.
- USER_DOMAIN_NAME: Windows domain name of current user.
- USER_EMAIL_ADDRESS: email address of current user.
- USER_FIRST_NAME: first name of current user.
- USER_FULL_NAME: full name of current user.
- USER_GENDER: gender of current user.
- USER_HOME_DIRECTORY: home directory of current user on client device.
- USER_INTERACTIVE: whether the current user works interactive.
- USER_PICTURES_DIRECTORY: pictures directory of current user on client device.
- USER_FAVORITES_DIRECTORY: favorites directory of current user on client device.
- USER DESKTOP_DIRECTORY: desktop directory of current user on client device.
- USER DOCUMENTS_DIRECTORY: documents directory of current user on client device.
- USER_PROFILE_DIRECTORY: profile directory of current user on client device.
- USER_LAST_LOG_ON: time of last log on of current user.
- USER_LAST_NAME: last name of current user.
- USER_LINKED_IN: LinkedIn name of current user.
- USER_MIDDLE_NAME: middle name of current user.
- USER MOBILE_NUMBER: mobile number of current user.
• USER_NATIONALITY: nationality of current user.
• USER_PHONE_NUMBER: phone number of current user.
• USER_PICTURE_URL: picture (URL) of current user.
• USER_SKYPE: Skype name of current user.
• USER_TITLE: title of current user.
• USER_TWITTER: Twitter name of current user.
• USER_WEB_SITE: personal website of current user.

Returns: Value of the parameter in the context namespace. SYS_CONTEXT

\[
\text{sys\_context} \quad ::= \quad \text{SYS\_CONTEXT}
\]

referenced by:
• functionExpression

\text{tan}:

Returns the tangent of the provided angle.

Parameters:
• Input: the angle to get the tangent of.

Returns: A number which represents the tangent of the provided angle. TAN

\[
\text{tan} \quad ::= \quad \text{TAN}
\]

referenced by:
• functionExpression

\text{times}:

Multiplies one number by the second number.

Parameters:
• First: a number to multiply.
• Second: a number to multiply with.

Returns: The first number multiplied by the second number. ASTERIX

\[
\text{times} \quad ::= \quad \text{ASTERIX}
\]

referenced by:
• arithmeticExpression

\text{translate}:

Translate replaces all occurrences of each character in from_string to its corresponding character in to_string.

Parameters:
• input: The string to replace a sequence of characters with another set of characters.
• from_string: The string that will be searched for in the input.
• to_string: All characters in the from_string will be replaced with the corresponding character in the to_string.
Returns: the input with all occurrences of each character in from_string replaced by its corresponding character in to_string. TRANSLATE

```plaintext
translate ::= TRANSLATE
```

Referenced by:
- `functionExpression`

**translate_resources:**
Replace all Invantive-style resources ('{res:...}') by their translation in the current language.

Parameters:
- `txt`: The string to replace resources in.

Returns: the input with all resources replaced by their translation.

```plaintext
translate_resources ::= TRANSLATE_RESOURCES
```

Referenced by:
- `functionExpression`

**trim:**
Trims whitespaces from both sides of the provided string.

Parameters:
- `Input`: The string from which to trim characters.

Returns: A string trimmed from whitespaces from both sides.

```plaintext
trim ::= TRIM
```

Referenced by:
- `functionExpression`

**trunc:**
Calculates the integral part of a number. Unless an amount of decimals is defined, in which case it calculates to the integer with the amount of decimals or date with the amount of positions.

Parameters:
- `Input`: A number or datetime to truncate.
- `Decimals [optional]`: A number to specify how many decimals it may truncate to in case of a number. In case of a datetime, it reflects the number of time positions, ranging from -2 for years to 2 for minutes.

Returns: The truncated input.

```plaintext
trunc ::= TRUNC
```

Referenced by:
- `functionExpression`
to_hex:

TO_HEX

\[
\text{to\_hex} : = \text{TO\_HEX}
\]

referenced by:

- functionExpression

unistr:

Converts a text with unicodes to regular characters.

Parameters:

- Input: text with unicodes.

Returns: The input converted to all regular characters.

\[
\text{unistr} : = \text{UNISTR}
\]

referenced by:

- functionExpression

upper:

Converts provided string to uppercase.

Parameters:

- Input: the string that will be converted to uppercase.

Returns: A string converted to uppercase.

\[
\text{upper} : = \text{UPPER}
\]

referenced by:

- functionExpression

urldescode:

Decodes a url.

Parameters:

- Url: url to decode.

Returns: The decoded url.

\[
\text{urldescode} : = \text{URLDECODE}
\]

referenced by:

- functionExpression

urllencode:

Encodes a url.

Parameters:
• Url: url to encode.

Returns: The encoded url. URLENCODE

\[
\text{urlencode} ::= \text{URLENCODE}
\]

referenced by:
• \text{functionExpression}

\text{unix_timestamp}:
Get the UNIX epoch time of a date/time.

Parameters:
• Input: A dateTime. Current date/time is used when no value is specified.

Returns: The UNIX epoch time. UNIX_TIMESTAMP

\[
\text{unix_timestamp} ::= \text{UNIX_TIMESTAMP}
\]

referenced by:
• \text{functionExpression}

\text{unzip}:
UNZIP

\[
\text{unzip} ::= \text{UNZIP}
\]

referenced by:
• \text{functionExpression}

\text{zip}:
ZIP

\[
\text{zip} ::= \text{ZIP}
\]

referenced by:
• \text{functionExpression}

\text{xmlcomment}:
Format a text as an XML comment.

Parameters:
• Input: the input which will be formatted as XML comment.

Returns: A text with the input as XML comment. XMLCOMMENT

\[
\text{xmlcomment} ::= \text{XMLCOMMENT}
\]

referenced by:
• \text{functionExpression}
xmldecode:
Returns the XML decoded input.

Parameters:
- Input: the input which will be decoded into XML.

Returns: An object which is the XML decoded input. XMLDECODE

xmldecode ::= XMLDECODE

referenced by:
- functionExpression

xmlencode:
Returns the XML encoded input.

Parameters:
- Input: the input which will be encoded into XML.

Returns: An object which is the XML encoded input. XMLENCODE

xmlencode ::= XMLENCODE

referenced by:
- functionExpression

xmlelement:
XMLELEMENT
xmlelement ::= XMLELEMENT

referenced by:
- functionExpression

xmltransform:
Applies an XSL style sheet to the XML instance.

Parameters:
- XML: XML type instance to be transformed with the XSL style sheet.
- Style sheet: The XSL style sheet to apply.

Returns: The XML instance with the style sheet applied to it. XMLTRANSFORM

xmltransform ::= XMLTRANSFORM

referenced by:
- functionExpression

xmlformat:
Pretty-print xml text.

Parameters:
- Xml: xml to pretty-print.

Returns: The pretty-printed XML text. XMLFORMAT

```xmlformat
::= XMLFORMAT
```

referenced by:
- `functionExpression`

**httpget:**

Collects all data from the URL as binary data.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- URL: the URL to collect the data from.

Returns: The collected data as an byte array. HTTPGET

```httpget
::= HTTPGET
```

referenced by:
- `functionExpression`

**httpget_text:**

Collects all data from the URL as text.

The URL must be publicly accessible. Use the NativePlatformScalarRequest view on cloud applications to directly access their web APIs.

Parameters:
- URL: the URL to collect the data from.
  - Encoding: the encoding from the data to receive, which is by default UTF8.

Returns: The collected data as text. HTTPGET_TEXT

```httpget_text
::= HTTPGET_TEXT
```

referenced by:
- `functionExpression`

**httppost:**

HTTPPOST

```httppost
::= HTTPPOST
```

referenced by:
- `functionExpression`
quarter:

Collect the quarter from a date.

Parameters:

• Input: A dateTime.

Returns: The quarter as an integer.

\[
\text{QUARTER}
\]

\[
\text{QUARTER} \quad ::= \quad \text{QUARTER}
\]

referenced by:

• functionExpression

quote_ident:

QUOTE_IDENT

\[
\text{QUOTE_IDENT} \quad ::= \quad \text{QUOTE_IDENT}

quote_nullable:

QUOTE_NULLABLE

\[
\text{QUOTE_NULLABLE} \quad ::= \quad \text{QUOTE_NULLABLE}
\]

referenced by:

• functionExpression

user:

Gets the user log on code.

Returns: The user log on code.

\[
\text{USER} \quad ::= \quad \text{USER}
\]

referenced by:

• functionExpression
year:
Collect the year from a date.
Parameters:
  - Input: A dateTime.
Returns: The year as an integer. YEAR
  
  \[
  \text{year} \mathrel{::=} \text{YEAR}
  \]

referenced by:
  - \text{functionExpression}

to_binary:
TO_BINARY
  
  \[
  \text{to_binary} \mathrel{::=} \text{TO_BINARY}
  \]

referenced by:
  - \text{functionExpression}

to_char:
Converts a value into text.
Parameters:
  - Input: value to convert.
Returns: The input converted to text. TO_CHAR
  
  \[
  \text{to_char} \mathrel{::=} \text{TO_CHAR}
  \]

referenced by:
  - \text{functionExpression}

to_date:
Converts a value into a datetime.
Parameters:
  - Input: value to convert.
Returns: The input converted to a datetime. TO_DATE
  
  \[
  \text{to_date} \mathrel{::=} \text{TO_DATE}
  \]

referenced by:
  - \text{functionExpression}

to Guid:
Converts a value into a guid.
Parameters:
  - Input: value to convert.
Returns: The input converted to a guid.

Converts a value into a number.

Parameters:
  • Input: value to convert.

Returns: The input converted to a number. TO_GUID

```
  to_guid [89] ::= TO_GUID [88]
```

referenced by:
  • `functionExpression [86]`

```
  to_number:
  TO_NUMBER

  to_number [89] ::= TO_NUMBER [89]
```

referenced by:
  • `functionExpression [86]`

```
  zero_blob:
  Generates a blob with 0-byte values.

  Parameters:
  • Length: Produce a blob with this length in terms of bytes.

  Returns: A blob with 0-byte values. ZERO_BLOB

  zero_blob [89] ::= ZERO_BLOB [89]
```

referenced by:
  • `functionExpression [86]`

```
  now:
  The time of the system clock in local time at the device where Invantive SQL runs.

  Returns: current date/time.

  NOW GETDATE SYSDATETIME parenthesisOpen parenthesisClose SYSDATE

  now [89] ::= ( NOW [89] | GETDATE [75] | SYSDATETIME [75] ) parenthesisisOpen parenthesisClose SYSDATEUTC

referenced by:
- *alias*
- *attributeIdentifier*
- *identifier*

**constant:**

A constant value with associated data type. The null value is typically associated with the null data type.

stringConstant numericConstant booleanConstant intervalConstant null
constant ::= stringConstant | numericConstant | booleanConstant | intervalConstant | null

referenced by:
- arithmeticExpression
- pSqlItemDeclaration

stringConstant:
A constant text value with varchar2 data type.

STRING_C stringConstant ::= STRING_C

referenced by:
- allColumnsSpecColumnNamePostfix
- allColumnsSpecColumnNamePrefix
- allColumnsSpecLabelPostfix
- allColumnsSpecLabelPrefix
- alterPersistentCacheDownloadStatement

- alterPersistentCacheSetStatement
- alterPersistentCacheSetTableOptions
- constant
- csvTableOptions
- intervalConstant
- jsonTableColumnSpec
- jsonTableSpec
- labeled
- resultSetName
- xmlTableColumnSpec
- xmlTableSpec

intervalConstant:
A constant interval value, reflecting the time span between two dates. The string constant consists of an integer number and unit of time, taken from the following list:
- Millisecond,
- second,
- minute,
- hour,
- day,
- week, and
- year.

The units may be postfixed with an 's' without changing meaning, like 'years'.
Valid interval values are for example: "5 seconds", "20 hours" and "1 year". There is no support for combined intervals such as "30 minutes and 30 seconds".

```
INTERVAL stringConstant
    intervalConstant ::= INTERVAL stringConstant
```
null:
The "unknown" value null.

```plaintext
null ::= NULL
```

pSqlBlock:
A PSQL block is a structure to define procedural logic. It can contain both procedural logic as well as SQL statements like "select".

```plaintext
pSqlDeclareSection pSqlBody
pSqlBlock ::= pSqlDeclareSection? pSqlBody
```

pSqlDeclareSection:
A PSQL declare section defines one or more local variables, which are available in the block and nested blocks.

```plaintext
DECLARE pSqlDeclaration
pSqlDeclareSection ::= DECLARE pSqlDeclaration+
```

pSqlDeclaration:

```plaintext
pSqlItemDeclaration
pSqlDeclaration ::= pSqlItemDeclaration
```

pSqlItemDeclaration:
An item declaration defines one named variable, based upon data type. The initial value can be added as a constant.

```
variableName dataType ASSIGNMENT_OPERATOR constant BATCH_SEPARATOR
```

referred by:
- `pSqlItemDeclaration`

**pSqlBody:**

A PSQL body contains the procedural logic as well as SQL statements. Variables must have been declared beforehand.

```
BEGIN pSqlStatement END BATCH_SEPARATOR
```

referred by:
- `pSqlBlock`

**pSqlStatement:**

A number of basic PSQL statements are available.

```
pSqlAssignmentStatement pSqlExecuteImmediateStatement pSqlIfStatement
pSqlLoopStatement pSqlNullStatement pSqlBlock sqlStatement BATCH_SEPARATOR
```

referred by:
- `pSqlBlockOrStatement`
- `pSqlBody`
- `sqlOrPSqlStatement`

**pSqlBlockOrStatement:**

A PSQL block or statement defines a procedural step or a SQL statement to be executed.

```
pSqlBlock pSqlStatement
```

referred by:
- `pSqlBlockOrStatements`
**pSqlBlockOrStatements:**

```sql
pSqlBlockOrStatement
    pSqlBlockOrStatements[102]
 ::= pSqlBlockOrStatement[101]+
```

referenced by:

- `pSqlElseIfExpression[103]`
- `pSqlForNumberLoopStatement[103]`
- `pSqlForRecordLoopStatement[104]`
- `pSqlIfStatement[103]`
- `pSqlWhileLoopStatement[104]`

**pSqlNullStatement:**

The null-statement is a NOP-statement (No Operator). The use of the null-statement is necessary when a PSQL statement is needed, but no activity needs to be performed such as with an if statement. The null-statement also makes explicit that a developer has considered the actions needed and found that no action applies to a specific scenario. This leads to improved code documentation.

```sql
NULL BATCHSEPARATOR
pSqlNullStatement[102]
 ::= NULL[100] BATCHSEPARATOR[15]
```

referenced by:

- `pSqlStatement[101]`

**pSqlAssignmentStatement:**

The assignment statement assign a new value to a variable. To assign the results of a SQL query to a variable, use a select ... into ... statement.

```sql
variableName ASSIGNMENT_OPERATOR expression BATCHSEPARATOR
pSqlAssignmentStatement[103]
```

referenced by:

- `pSqlStatement[101]`

**pSqlExecuteImmediateStatement:**

The execute immediate PSQL statement enables the use of SQL statements that are compiled at runtime. For instance dynamic DDL statements can not always be executed on compiled time and the execute immediate enables these.

```sql
EXECUTE IMMEDIATE expression BATCHSEPARATOR
pSqlExecuteImmediateStatement[102]
```
pSqlIfStatement:
The if-statement performs conditional logic. When the boolean expression after if holds, the PSQL block after the ‘then’ will be executed. Other branches can be specified using an elsif. Otherwise, and only when specified, the logic after the else is executed.

```psql
IF booleanExpression THEN pSqlBlockOrStatements pSqlElseIfExpression ELSE pSqlBlockOrStatements END IF BATCH SEPARATOR
```

pSqlElseIfExpression:
ELSIF booleanExpression THEN pSqlBlockOrStatements

```psql
ELSIF booleanExpression THEN pSqlBlockOrStatements
```

pSqlLoopStatement:
A variety of PSQL statements for loops are available.

```psql
pSqlForNumberLoopStatement pSqlForRecordLoopStatement pSqlWhileLoopStatement
```

pSqlForNumberLoopStatement:
This PSQL integer loop statement iterates over a range of integer values, executing PSQL statements for each iterated value. The iterations go from the first value to the last value in increments of 1. The iterations go backward in decrements of 1 when ‘reverse’ is specified.

```psql
FOR variableName IN REVERSE numericConstant variableName DOT DOT numericConstant variableName LOOP pSqlBlockOrStatements END LOOP BATCH SEPARATOR
```
pSqlForNumberLoopStatement::= FOR variableName IN REVERSE? ( numericConstant | variableName ) DOT DOT ( numericConstant | variableName ) LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

referenced by:
- pSqlLoopStatement

pSqlForRecordLoopStatement:
This PSQL result set loop statement iterates over a result set returned by an Invantive SQL query. The PSQL statements are executed for each record. The record's specific values can be retrieved using the variable.

FOR variableName IN PARENTHESIS_OPEN selectStatement PARENTHESIS_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

pSqlForRecordLoopStatement::= FOR variableName IN PARENTHESIS_OPEN selectStatement PARENTHESIS_CLOSE LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

referenced by:
- pSqlLoopStatement

pSqlWhileLoopStatement:
This PSQL while loop statement executes PSQL statements as long as the specified boolean condition evaluates to true at loop end.

WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

pSqlWhileLoopStatement::= WHILE booleanExpression LOOP pSqlBlockOrStatements END LOOP BATCHSEPARATOR

referenced by:
- pSqlLoopStatement

variableName:

9.2 Providers

The providers described here are available on all platforms.

9.2.1 Provider Atom10

Atom version 1.0.

Code for use in settings.xml: Atom10

Alias: atom

Status: Production

Available in Editions: Paid, Open Data, Community

9.2.2 Provider AutoTask

AutoTask service management.

Code for use in settings.xml: AutoTask

Alias: autotask

Status: Non-production

Available in Editions: Paid

Non-technical Documentation: http://severa.visma.com

9.2.3 Provider CbsNl

Centraal Bureau voor de Statistiek.

Code for use in settings.xml: CbsNl

Alias: cbsnl

Status: Production

Available in Editions: Paid, Open Data, Community

Provider Attributes

The following provider attributes are available for CbsNl:

<table>
<thead>

9.2.6 Provider DataDictionary

Invantive SQL data dictionary.

Code for use in settings.xml: DataDictionary
Alias: dd
Abbreviation: dd
Status: Production
Available in Editions: Paid
String-comparison is Case-sensitive: true
Use Catalog in Full Name: true
Use Schema in Full Name: true
Updated: 10-09-2020 00:07 using Invantive SQL version 20.1.206-BETA+2915.

## Connector Attributes

The Data Dictionary connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>

9.2.16 Provider Freshdesk

Freshdesk, customer happiness for exceptional customer service.

Code for use in settings.xml: Freshdesk

Alias: freshdesk
Authentication

Authentication can be done using one of the following two alternatives:

1. Using the user log on code, password and company also used on the Freshdesk website.
2. Using an API key and company.

Authentication using user log on code and password is recommended for general use. The company is the name before '.freshdesk.com' in the URL used to log on to Freshdesk in a browser.

The API key can be found in the 'Edit Profile' page in Freshdesk, as described on https://support.freshdesk.com/support/solutions/articles/225435-where-can-i-find-my-api-key.

Usage Limits

Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per hour depends on your Freshdesk plan. The default usage limits vary between 1.000 and 5.000 calls per hour. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Provider Attributes

The following provider attributes are available for Freshdesk:

<table>
<thead>
<tr>

### 9.2.23 Provider Kadaster

Kadaster.

Code for use in settings.xml: Kadaster

Alias: kadaster

Status: Production

Available in Editions: Paid, Open Data, Community

Technical Documentation: [https://app.swaggerhub.com/api/pdok/brk](https://app.swaggerhub.com/api/pdok/brk)

**Provider Attributes**

The following provider attributes are available for Kadaster:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>api-url</td>
<td>URL to access the API.</td>
<td></td>
<td>✓</td>
<td></td>
<td></td>
</tr>
<tr>
<td>download-error-internet-dow-n-max-tries</td>
<td>Maximum number of tries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow-n-sleep-initial-ms</td>
<td>Initial sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow-n-sleep-max-ms</td>
<td>Maximum sleep in milliseconds between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>download-error-internet-dow-n-sleep-multiplier</td>
<td>Multiplication factor for sleep between retries when the Internet connection seems down during retrieval of data.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>

### 9.2.24 Provider KeePass

Security-sensitive storage of keys.

Code for use in settings.xml: KeePass

Alias: KeePass

Abbreviation: kp

Status: Non-production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Updated: 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

### Connector Attributes

The KeePass connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from Set SQL-Statement</th>
<th>Set from Set Providers File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-bytes</td>
<td>Approximate maximum size in bytes of batch when bulk inserting</td>
<td>10000000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>bulk-insert-page-size-rows</td>
<td>Number of rows to insert per batch when bulk inserting</td>
<td>10000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Default Value</td>
<td>Set from Connection String</td>
<td>Set from Set SQL-Statement</td>
<td>Set from Connectors File</td>
<td>Set from Log On</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------</td>
<td>---------------</td>
<td>----------------------------</td>
<td>----------------------------</td>
<td>--------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

9.2.28 Provider Magento

Magento web shop.

Code for use in settings.xml: Magento

Alias: magento

Status: Non-production

Available in Editions: Paid

Technical Documentation: [http://devdocs.magento.com/guides/v2.0/rest/bk-rest.html](http://devdocs.magento.com/guides/v2.0/rest/bk-rest.html)

9.2.29 Provider Mail

SMTP mail.

Code for use in settings.xml: Mail

Alias: mail

Abbreviation: ml

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Updated: 10-09-2020 00:08 using Invantive SQL version 20.1.206-BETA+2915.

**Connector Attributes**

The Mail connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL-Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulk-delete-page-size-rows</td>
<td>Number of rows to delete per batch when bulk deleting</td>

### 9.2.30 Provider Mendix
Mendix version control in the cloud or on-premises.

Code for use in settings.xml: Mendix

Alias: Mendix

Status: Non-production

Available in Editions: Paid

Technical Documentation: [https://docs.mendix.com/ee/api/](https://docs.mendix.com/ee/api/)

Non-technical Documentation: [https://mendix-apps.com](https://mendix-apps.com)

### 9.2.31 Provider MicrosoftGraph
Microsoft Graph (as used by Office 365).

Code for use in settings.xml: MicrosoftGraph

Alias: graph

Status: Production

Available in Editions: Paid

Technical Documentation: [https://graph.microsoft.io/en-us/](https://graph.microsoft.io/en-us/)

### 9.2.32 Provider MySql
Oracle MySQL.

Code for use in settings.xml: MySql

Alias: mysql

Status: Production

Available in Editions: Paid
## Provider Attributes

The following provider attributes are available for MySQL:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Providers File</th>
</tr>
</thead>
<tbody>
<tr>
<td>command-timeout-sec</td>
<td>Number of seconds after which a command times out.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>force-case-sensitive-identifiers</td>
<td>Consider identifiers as case-sensitive independent of the platform capabilities.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>forced-casing-identifiers</td>
<td>Forced casing of identifiers. Choose from Unset, Lower, Upper and Mixed.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

<td>✓</td>
</tr>
<tr>
<td>invantive-sql-shuffle-fetch-results-data-containers</td>
<td>Whether to shuffle results fetched from data containers.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>invantive-use-cache</td>
<td>Whether to cache the results of a query.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-length-identifiers</td>
<td>Non-default maximum length in characters of identifier names.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-number-of-pooled-connections</td>
<td>Maximum number of concurrent pooled connections.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-pooled-connection-ms</td>
<td>Maximum time in ms to wait for acquiring a free connection from a pool of connections.</td>
<td>30000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>maximum-sleep-acquire-unpooled-connection-ms</td>
<td>Maximum time in ms to wait for acquire a free connection when there is no connection pooling.</td>
<td>60000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>preferred-number-of-pooled-connections</td>
<td>Preferred number of concurrent pooled connections.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>prefix-bind-variable-in-list</td>
<td>Prefix for bind variables used in an IN-list</td>
<td>i</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

<tr>
<td>prefix-bind-variable-normal</td>
<td>Prefix for bind variables used in all cases except in an IN-list</td>
<td>w</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>prefix-renamed-columns</td>
<td>Prefix appended to columns whose names occur multiple times in the column list of a query</td>
<td>column</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>pre-request-delay-ms</td>
<td>Pre-request delay in milliseconds per request.</td>
<td>0</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>requests-parallel-max</td>
<td>Maximum number of parallel data requests from individual partitions on the data container.</td>
<td>32</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>slot-based-rate-limit-length-ms</td>
<td>Length in ms of a slot-based rate limit.</td>
<td>60000</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>slot-based-rate-limit-slots</td>
<td>Number of slots of a slot-based rate limit. Null means no slot-based rate limit</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>standardize-identifiers</td>
<td>Rewrite all identifiers to the preferred standards as configured by standardize-identifiers-casing and maximum-length-identifiers.</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>standardize-identifiers-casing</td>
<td>Rewrite all identifiers to the recommended standard platform-specific casing when</td>
<td>True</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>
### 9.2.33 Provider Nasa

NASA space information.

**Code for use in settings.xml:** Nasa

**Alias:** nasa

**Status:** Production

**Available in Editions:** Paid, Open Data, Community

**Technical Documentation:** [https://api.nasa.gov/api.html#NeoWS](https://api.nasa.gov/api.html#NeoWS)

**Non-technical Documentation:** [https://api.nasa.gov/api.html#NeoWS](https://api.nasa.gov/api.html#NeoWS)

### Provider Attributes

The following provider attributes are available for Nasa:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Providers File</th>

9.2.55 **Provider Teamleader: Teamleader CRM.**

Teamleader is a cloud solution for customer management. Teamleader includes CRM as well as project and tickets. Teamleader can be extended by defining custom fields on several core concepts.

Code for use in settings.xml: Teamleader

Alias: teamleader

Abbreviation: tlr

Status: Production

Available in Editions: Paid

String-comparison is Case-sensitive: true

Use Catalog in Full Name: true

Use Schema in Full Name: true

Updated: 10-09-2020 00:09 using Invantive SQL version 20.1.206-BETA+2915.

**Documentation**

Authentication

Authentication can be done using one of the following two alternatives:

1. Using the user log on code and password also used on the Teamleader website.
2. Using an API group and API secret.

Authentication using user log on code and password is recommended for general use. The user must have access to all functionality since by default all so-called 'scopes' are requested. The scopes can be manually entered to be able to log in with a restricted accounts. Please provide a space-separated list chosen from companies, contacts, deals, departments, events, invoices, products, projects, quotations, subscriptions, tickets, todos, users.

The API group and secret can be found on [https://app.teamleader.eu/apiwebhooks.php?show_key](https://app.teamleader.eu/apiwebhooks.php?show_key).

**Usage Limits**
Invantive SQL executes API calls to retrieve and upload data. The number of API calls allowed per 5 seconds is 25. Invantive SQL ensures that within your session the number of calls allowed per hour is not exceeded.

To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Custom Fields

Custom fields for which one value can be entered on an object are added to the table representing the object. For instance, a custom field 'needsaudit' on 'project', will be added as a column 'c_needsaudit' on the 'project' table. The name of the additional column directly derives from the custom field name. Almost all changes, including adding numbers or reading characters, will result in the data model being changed.

Custom fields which can have no, one or multiple values ('set' custom fields) are reflected in the data model by tables with a name constructed of the object name, an underscore plus the name of the custom field. For example, a custom field named 'Multiple Selection' on 'Task' will add a table 'task_multipleselection' to the data model.

Custom fields are unique to each Teamleader environment. When the existence of specific custom field is not guaranteed, please use generic solutions like the tables 'CustomFieldDefinitions', 'custom_fields', 'custom_field_options', 'custom_field', 'Custom_Field-All', 'Custom_Field_Types' and their object-specific custom field value tables like 'ticket_-custom_field_values_by_id'.

Connector Attributes

The Teamleader connector can be configured using the following attributes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Default Value</th>
<th>Set from Connection String</th>
<th>Set from SQL Statement</th>
<th>Set from Connectors File</th>
<th>Set from Log On</th>
</tr>
</thead>
<tbody>
<tr>
<td>force-custom-field-to-string</td>
<td>Whether to force custom field values shown in columns to be represented as string instead of the registered type.</td>
<td>False</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>scopes</td>
<td>Space-separated and case-sensitive list of scope for OAuth only. Leave empty for all.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-client-id</td>
<td>The client ID is a unique identifier of your application. It is generated by registering an application.</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>api-client-secret</td>
<td>The client secret is to be kept confidential. Such as a password for a login code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.</td>
<td>***</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

Note: The table shows parameters and default values for various configurations, including secrets, connection strings, SQL statements, log on methods, and error handling parameters. Each parameter is associated with a set of options for setting it, including setting from a connection string, SQL statement, connectors file, or log on method.

9.2.73 Providers

The providers described here are available on all platforms.
9.3 Configuration

9.3.1 Network

The list of available databases is maintained in so-called 'settings.xml' files. These file names all start with 'settings' and end with '.xml'.

Interactive and OS-Applications

A default file 'settings.xml' is placed in the user's home directory folder 'Invantive' during discovery of databases in interactive or OS-applications. Additional settings files may be placed in this folder too.

Web Applications

For web applications, the folder App_Data/Config must contain the settings.xml files. Additional settings files may be placed in this folder too.

Additional Locations

Using the environment variable INVANTIVE_SETTINGS_FILE_PATH, you can specify a different file name and path for the default settings.xml file.

Settings.xml is not searched for at other locations.

Structure

The settings files all have the following structure in XML format; The full specification is available in xsd format and online.

9.3.2 License

The license key controls the availability of functionality, providers and limits of your Invantive products. A license key is associated with a license contract. A license contract has a unique code consisting of a 'L' plus a number. Each license contract can have multiple license keys.
License keys are automatically revoked when they have not been used for three months.

When a license contract concerns a subscription, the contract is automatically ended when it has not been used for three months.

**Interactive and OS-Applications**

For interactive and OS-applications, a file named 'invantive.lic' is searched within the user's home directory folder 'Invantive'. The license key for use of Invantive products is normally stored within the product's configuration files after loading it through the user interface of the product.

**Web Applications**

For web applications, a file named 'invantive.lic' is searched within the folder 'App_Data/Config'.

**Additional Locations**

Using the environment variable INVANTIVE_LICENSE_FILE_PATH, you can specify a deviating location for the default license file 'invantive.lic'.

**9.3.3 Logging**

**9.3.3.1 Trace**

During use of the products, a continuous stream of relevant trace messages is being sent to the trace listeners. On Microsoft Windows, you can use the Microsoft program 'dbgview.exe' to see the trace messages.

Trace options are only available when the environment variable 'INVANTIVE_TRACE_ACTIVE' is set to any non-empty value.

The trace messages are also stored in trace files when the environment variable 'INVANTIVE_TRACE_TO_FILE' is set to 'true'.

The default location of the trace files is the folder for temporary files on interactive and OS-applications. The default location for web applications is 'App_Data\Trace'. An alternative folder for trace files can be specified by setting the environment variable 'INVANTIVE_TRACE_FOLDER'.

A limited amount of information is sent to the trace when an error occurs. The call stack and the natural key can be sent to trace by setting the environment variable 'INVANTIVE_TRACE_OWN_EXCEPTION_DETAILS' to 'true'.

**Log to Amazon CloudWatch**

The trace can be logged to Amazon CloudWatch by configuring the following environment variables:

- INVANTIVE_TRACE_TO_CLOUDWATCH: change to True to activate logging to CloudWatch
- INVANTIVE_TRACE_CLOUDWATCH_ACCESS_KEY: the access key as generated on Amazon.
- INVANTIVE_TRACE_CLOUDWATCH_SECRET_KEY: the corresponding secret key.
- INVANTIVE_TRACE_CLOUDWATCH_REGION: the geographical region to log the messages.
• INVANTIVE_TRACE_CLOUDWATCH_GROUP: the log group to use for logging.

The identity associated with the access key must allow logging to CloudWatch.

Amazon CloudWatch logging is rate limited. Messages may not be logged during periods of intensive activity.

The log format is JSON-based as shown:

Microsoft Power BI

When used in combination with Microsoft Power BI, please note that Power BI tries to disable all trace logging by third party drivers. Invantive SQL has limited tracing available through Power BI. To activate: in Power BI go to 'Options and Settings', then 'Options' and choose 'Diagnostics' in the Global group. Place a checkmark next to 'Enable tracing'. This setting will remain effective till you restart Microsoft Power BI.

Direct Trace

Trace messages generated by Invantive can also be logged to file outside the Microsoft .NET trace mechanism. This is called "direct trace".

The advantages of direct trace are:

• Direct trace starts very early in program execution, even before the normal trace mechanism is activates. It therefore allows analysis of start-up problems.

• Direct trace works independent of the normal trace mechanism. It is therefore available even when the environment manages Microsoft .NET trace, such as with Power BI.

The disadvantages of direct trace are:

• The use of direct trace reduces performance significantly. Therefore only enable direct trace when needed.

To activate direct trace, please set the environment variable 'INVANTIVE_DIRECT_TRACE_FILE_PATH' to the file path of the intended log file.

It is recommended to include the placeholder '{PID}' in the file name when you expect to run multiple OS-processes with direct trace.

A commonly used setting for INVANTIVE_DIRECT_TRACE_FILE_PATH is c:\temp\invantive-direct-trace-{PID}.log.
Mac OSX and Linux

Set the environment variable `COMPlus_DebugWriteToStdErr` to write trace messages to the console of Microsoft .NET Core applications:

```bash
export COMPlus_DebugWriteToStdErr=1
```

Note that the Microsoft .NET Core implementation on Mac OSX and Linux are restrained in the default stack size. On StackOverflowException such as with Exact Online, please increase stack size first using:

```bash
export COMPlus_DefaultStackSize=10000000
```

9.3.3.2 Execution Log

Every completed execution of an Invantive product appends an entry to the local execution log. The execution log is in XML-format and located by default at `%USERPROFILE%\executionlog.xml`.

The name and location of the execution log can be altered by placing the full path and file name in the environment variable `INVANTIVE_EXECUTION_LOG_FILE`.

The root tag `EXECUTIONLOGS` contains an `EXECUTIONLOG` for every execution once finished. The following elements are available:

- **VERSION**: the record format, always ’1’.
- **MESSAGEUID**: the UID of the message as registered on Invantive Cloud.
- **IIID**: the Invantive Installation ID of the device.
- **SESSIONID**: the ID of the session.
- **LICENSECODE**: the code of the subscription contract.
- **LICENSEKEYID**: the numeric ID of the license key.
- **MACHINE**: the name of the device.
- **EXECUTABLENAME**: the name and path of the executable.
- **APPLICATIONNAME**: the name of the Invantive application.
- **APPLICATIONVERSION**: the version of the Invantive application.
- **USERNAME**: the name of the operating system user.
- **PROCESSID**: the ID of the OS process.
- **STARTTIMEUTC**: the start time of the process (UTC).
- **ENDTIMEUTC**: the end time of the process (UTC).
- **EXITCODE**: the exit code of the process.
- **EXITLEVEL**: the textual description of the exit code.
- **EXITMESSAGECODE**: the message code associated with the execution exit.
- **ISHEADLESS**: whether the process ran headless.
- **COMPUTERMANUFACTURER**: the name of the device’s manufacturer.
• COMPUTERMODEL: the model of the device.
• OSVERSION: the version of the operating system.
• PHYSICALMEMORYINBYTES: the number of bytes in the physical memory.

9.3.4 Debugging
Invantive software products contain a number of features to aid analysis of problems.

9.3.4.1 Translations
During use of the products, the user interface is adapted to the user interface language based upon the environment.

The translation involves replacing so-called "resource codes" by their translation.

The translation can be disabled by setting the environment variable 'INVANTIVE_NO_TRANSLATE' to a non-empty value.

10 Invantive SQL for Windows
The Windows-specific features of Invantive SQL are documented in this section.

10.1 Internal Consistency Checks
Invantive SQL executes many internal consistency to ensure correctness of the results. Some of these consistency checks are only done during testing phases for reasons such as performance. These checks are automatically checked on testing environments and excluded on production environments.

However, during test or production use you can explicitly disable or enable these checks by setting environment variables to the value 'true' or 'false'. The checks can individually be disabled or enabled, or all together.

To explicitly enable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to true. To explicitly disable all consistency checks, set the environment variable INVANTIVE_CHECK_ALL to false.

First determine with help of support the message code to explicitly enable or disable a consistency check. Then set the environment variable INVANTIVE_CHECK_<message code> to the correct value.

11 Invantive Script
11.1 Introduction
Invantive Script is a scripting language available within the independent and embedded Invantive Query Tool and Invantive Data Hub. Invantive Script extends Invantive SQL, but also works in combination with native SQL databases. It is always executed on the device running the program.

11.2 Variables
Invantive Script variables are globally named variables with a string value. The names are all case-insensitive.

The value of an Invantive Script can be used in SQL statements or variable value assignment by using the syntax

{ NAME }
which expands run-time to the string value of the variable. Expansion is recursive: it repeats itself till there are no Invantive Script variables left to expand.

An error is triggered when an undefined variable name is used.

11.2.1 Define Variable Value

A variable is defined and assigned a value in one combined statement using the syntax:

```
local define NAME "VALUE"
```

The value may refer to other variables using the \${NAME} notation, such as:

```
local define OUT_PATH "c:\temp"
local define OUT_FILE_NAME_PATH \${OUT_PATH}\my-file.txt"
```

Encrypted values can also be used as source for a variable using the syntax:

```
local define encrypted NAME "ENCRYPTED VALUE"
```

11.2.2 Undefine Variable

The definition of a variable can be removed using:

```
local undefine NAME
```

11.2.3 Pre-defined Variables

A number of pre-defined variables exist:

- Translation resources: name starts with 'res:', followed by a resource code. For instance, the variable 'res:itgen_description' will expand to the string value of the resource 'itgen_description' which is 'Description' on an English user interface and 'Omschrijving' on a Dutch user interface.

- Last result outcome: name starts with 'outcome:', followed by a 0-based row and column number separated by comma. The variable 'outcome:0,0' will expand to the string value of the first row and column in the result of the last SQL executed.

- Execution statistics: name starts with 'stat:'. Pre-defined list of:
  - errorcountignore: number of errors fully ignored.
  - errorcountcontinue: number of errors ignored, but memorized for exit code.
  - statementcount: number of statements executed.

- Application variables: name starts with 'application:'.

- Database variables: name starts with 'database:'.

- System variables: name starts with 'system:'.

11.2.4 System Variables

A number of pre-defined system variables exist:

- environmentvariable:NAME: value of the operating system environment variable with the name 'NAME'.
- antivirusinfo: description of the anti-virus product in use.
- clipboardtext: current contents of the Windows clipboard.
- clrversion: full version of the Common Language Runtime.
• clrversion:major: major version of the Common Language Runtime.
• clrversion:majorrevision: major revision of the Common Language Runtime.
• clrversion:minor: minor version of the Common Language Runtime.
• clrversion:minorrevision: minor revision of the Common Language Runtime.
• commandline: command line for this process.
• currentdirectory: path of the current working directory.
• date: date of the workstation.
• datet ime: date and time of the workstation.
• hasteamviewer: whether TeamViewer in version 10 is present.
• installationfolder: Obsoleted.
• ipaddress: primary IP-address of the workstation on the internal network.
• ipaddressexternal: primary IP-address of the workstation on the Internet.
• is64bitoperatingystem: whether the operating system runs in 64-bit mode.
• is64bitprocess: whether the current process runs in 64-bit mode.
• isvirtualmachine: whether the workstation is a virtual machine.
• logicalcorecount: number of logical cores of the workstation.
• machinename: NetBIOS name of the workstation.
• now: date and time of the workstation in the format YYYYMMDDHH24MISS.
• os: current platform version number.
• osname: human-friendly name of the operating system.
• physicalcorecount: number of physical cores in the workstation.
• physicalmemoryinbytes: number of bytes in the physical memory of the workstation.
• processorcount: number of physical processors in the workstation.
• processorid: ID of the processor.
• sid: security identifier.
• stacktrace: stack trace of the program.
• systemdirectory: fully qualified path of the system directory.
• systempagesize: number of bytes in the system memory page.
• time: time of the workstation.
• user: user of the workstation.
• userdesktopdirectory: fully qualified path of the desktop directory of the current user.
- `userdocumentsdirectory`: fully qualified path of the documents directory of the current user.
- `userdomain`: network domain name associated with the current user.
- `userfavoritesdirectory`: fully qualified path of the favorites directory of the current user.
- `userhomedirectory`: fully qualified path of the home directory of the current user.
- `userinteractive`: whether the current process is running in interactive mode.
- `userpicturesdirectory`: fully qualified path of the pictures directory of the current user.
- `userprofiledirectory`: fully qualified path of the profile directory of the current user.
- `workingset`: amount of physical memory mapped to the process context.

### 11.2.5 Application Variables

A number of pre-defined application variables exist:

- `applicationfolder`: folder from which the application is running.
- `cachedirectory`: directory in which the cached files for the current application version are loaded.
- `centralsettingsdirectory`: directory below which all configuration settings are stored.
- `connectionname`: name of last used database in Invantive Keychain.
- `containertitle`: title of the form containing the control (extended with tab page title if present).
- `copyright`: application's copyright text.
- `currentversion`: label of the application's version.
- `currentversionshort`: short description of the application's version.
- `datadirectory`: directory in which deployed data files are stored.
- `defaultsettingsfile`: default databases settings configuration file.
- `expirationdate`: application's build expiration date (if any).
- `globalfirstuse`: date time of any first use of any Invantive product.
- `globalnumberofapplicationstarts`: number of application starts of any Invantive application.
- `globalusersettingsfile`: global user.settings file with preferences.
- `hasbeenoptimized`: whether or not the application has been optimized.
- `helpfilelocationproducer`: full path to the help file.
- `installericonfile`: name of the icon file to be used located within the startup directory.
- **internalname**: application's internal name.
- **invantivetempdirectory**: directory in which the temp files for Invantive software are stored.
- **iscurrentusersystemuser**: whether the current user is a system user.
- **isfirstrun**: whether this is the first run of the application installation since installation or upgrade.
- **isloggedon**: whether a connection has been made and is still open to a database.
- **lastavailablebandwidth**: last available measured bandwidth.
- **lastavailablelatency**: last available measured latency.
- **lastlanguage**: last user user interface language.
- **loggingfile**: full file name of the logging file with unprocessed log messages.
- **multicorejitprofilefile**: full file name of the Multi-Core JIT Profile file.
- **name**: name of the application used in dialogs.
- **nameversion**: name of the application used in dialogs, followed by the version in brackets.
- **newsitemcache**: full file name of the news items cache.
- **numberofconnectionsmade**: number of database connections made by any Invantive application.
- **optimizationdirectory**: directory in which the application optimization files for the current application are loaded.
- **optimizationlogfile**: full file name and path to the optimization log file for this process.
- **productinstallationfirstuse**: date time of any first use of this Invantive product installation.
- **productinstallationnumberofapplicationstarts**: number of application starts of this Invantive product installation.
- **productinstallationusersettingsfile**: user's settings for a specific product and its installation.
- **productnumberofapplicationstarts**: number of application starts of this Invantive product.
- **productusersettingsfile**: user's settings for a specific product.
- **querytoolcentraldirectory**: central folder for Invantive Query Tool.
- **serverlicenseexists**: whether the server license exists.
- **serverprefixurl**: server prefix URL.
- **starterdirectory**: directory in which the Invantive Starter parameter files are stored.
- **supportemail**: localized support email address.
11.2.6 Database Variables
A number of pre-defined database variables exist:
- **connection**: name of the last used database according to Invantive Keychain.
- **datacontainerid**: ID of the first data container used.
- **partitions**: comma-separated list of partition codes across all data containers used.
- **ultimateprovider**: name of the ultimately used first provider across Invantive Web Service hops.
- **useremailaddress**: email address of the user on the first data container used.
- **userfullname**: full name of the user on the first data container used.
- **userldapusername**: LDAP user name of the user on the first data container used.
- **userlogincode**: login code of the user on the first data container used.
- **version**: version of the RDBMS platform of the first data container used.

11.3 Statements
Invantive Script supports a number of statements.

11.3.1 Comment
Using the syntax
```
local remark TEXT
```
you can add a remark to your script.

11.3.2 Sleep
When a wait statement is executed following the syntax
```
local wait SECONDS
```
such as
```
local wait 5
```
the execution of an Invantive Script will be postponed during the indicated number of seconds.

11.3.3 On Error
The default behavior of Invantive Script is to end the execution of a script when an error occurs and to continue when no error occurs.
Using the on error statement with the syntax:

```csharp
local on error SPECIFICATION
```

you can control the behavior when an error occurs. The available variants for specification are:

- default: as described above.
- continue: remember that an error occurred, continue execution but exit the program with the exit code that would have been raised during default behavior.
- ignore: ignore the error and forget it ever occurred.
- exit success: exit the program with exit code 0.
- exit failure: exit the program with exit code 1.
- exit warning: exit the program with exit code 2.

### 11.3.4 Encrypt Value

A value can be encrypted with reversible encryption on Windows platforms using the roaming profile key and on other platforms using an Invantive-managed key. The syntax is:

```csharp
local encrypt variable value "VALUE" [label "LABEL"]
```

The encrypted value can be used for an encrypted connection string in settings.xml. The encrypted value can also be used to assign a variable.

### 11.3.5 Encrypt Password

A password can be encrypted with reversible encryption on Windows platforms using the roaming profile key and on other platforms using an Invantive-managed key. The syntax is:

```csharp
local encrypt password ["VALUE"] [label "LABEL"]
```

The encrypted value can be used for an encrypted connection string in settings.xml. The encrypted value can also be used to assign a variable.

### 11.3.6 Encrypt Connection String

A connection string can be encrypted with reversible encryption on Windows platforms using the roaming profile key and on other platforms using an Invantive-managed key. The syntax is:

```csharp
local encrypt connection string ["VALUE"] [label "LABEL"]
```

The encrypted value can be used for an encrypted connection string in settings.xml. The encrypted value can also be used to assign a variable.

### 11.3.7 Define Output Column

Output can be printed in text mode using a columnar layout. The column statement enables configuration of the layout using the syntax:

```csharp
local column NAME heading "HEADING" (width "WIDTH")
```

The heading is printed above the column contents and the width in characters allows control of the column's width.

The layout for a column can be undefined using

```csharp
local column NAME clear
```
11.3.8 **Show Message**

A message can be shown to the user using the syntax:

```
local show message "TEXT"
```

11.3.9 **Re-execute Last SQL**

The last SQL statement can be executed again using the syntax:

```
local execute last sql
```

11.3.10 **Exit**

The program can be exited using the syntax:

```
local exit [EXITCODE]
```

in which the exit code is optional.

11.3.11 **Log on**

A connection to a database can be made using the syntax:

```
local log on connection "<DATABASENAME>" user "<LOGONCODE>" encryptedpassword "<ENCRYPTEDPASSWORD>" silent
```

where the database name consists of the group name, a back slash and the database name.

11.3.12 **Discovery**

The database discovery process can be initiated using the syntax:

```
local discover connections
```

11.3.13 **Create Directory**

A directory can be created using the syntax:

```
local create directory "NAME"
```

11.3.14 **Move Files**

Files can be moved using the syntax:

```
local move files "SPECIFICATION" to "SPECIFICATION"
```

11.3.15 **Delete Files**

Files can be deleted using the syntax:

```
local delete files "SPECIFICATION"
```

11.3.16 **Open File**

A file can be opened using the default handler using the syntax:

```
local open file "FILENAME"
```

11.3.17 **Open URL**

A URL can be opened using the default handler using the syntax:

```
local open url "FILENAME"
```

11.3.18 **Host**

An operating-system command can be executed using the syntax:

```
local host "EXECUTABLE" "ARGUMENTS" "WORKING DIRECTORY"
```

For example, the following statement starts the Windows Explorer:

```
local host "explorer.exe" "" ""
```
11.3.19 Export Results

The results from the last query can be exported to a file using the syntax:

```plaintext
local export results
(as "<FILENAME-WITH-PATH>"|using filename column <COLUMN-NAME>)
format FORMAT
[split on <COLUMN-NAME>]
[tablename <TABLE-NAME-FOR-SQL>]
[columns <COLUMN1>,<COLUMN2>]*
[HEADERS]
[fieldseparator "<FIELD-SEPARATOR-TEXT>"]
[recordseparator "<RECORD-SEPARATOR-TEXT>"]
[quotingcharacter "<QUOTING-TEXT>"]
[escapedquotingcharacter "<ESCAPED-QUOTING-TEXT>"]
[(include|exclude) sql]
[limit <NUMBER> rows]
[((remove|keep) field separator in content)|replace field separator in content by "<REPLACEMENT-TEXT>"]
[((remove|keep) record separator in content)|replace record separator in content by "<REPLACEMENT-TEXT>"]
```

The most frequently used variant is:

```plaintext
local export results as "c:\temp\output.xlsx" format xlsx
```

which exports the results as an Excel workbook.

**Output File Name**

The name of the output file can either be hard-coded using

```plaintext
as "<FILENAME-WITH-PATH>"
```

or taken from a column using

```plaintext
using filename column <COLUMN-NAME>
```

Multiple output files can be generated, each with different part of the results, when 'split on' is specified. A new output file is started on every change on the value of the split on column.

**Output Formats**

The following export formats are supported:

- **xlsx**: Excel .xlsx file.
- **csv**: comma-separated values.
- **tsv**: tab-separated values.
- **txt**: text.
- **html**: HTML.
- **rtf**: Rich Text Format.
- **docx**: Word .docx format.
- **xps**: Microsoft XPS page format.
- **sql**: SQL statements.
- **pdf**: PDF page format.
• json: JSON format.
• jsondataset: JSON data set format.
• xml: XML.
• sqlselect: SQL select query.
• sqlcreatetable: SQL create table statement. The table name can be specified by specifying a value for 'tablename'.

The csv, tsv and text output formats allow specification of separator and quoting behavior:
• fieldseparator: the characters to use as field separator.
• recordseparator: the characters to use as record separator.
• quotingcharacter: the character to use as quoting character for field and record separator in content.
• escapedquotingcharacter: the character to use to escape the quoting character.

The field and record separators in content can also be removed or replaced by a value using the 'remove/keep' specification.

**Rows**

The maximum number of rows to include in the export can be specified using a 'limit' specification.

**Columns**

The list of columns to include can be specified using a list of column names specified after 'columns'.

**Headers**

The headers can be configured using one of the following three options:

• exclude headers: no headers are included.
• include headers: headers with user-friendly labels are included.
• include technical headers: headers with the column names are included.

11.3.20 Export Documents

Results from queries containing documents in binary or text format can be exported to output files using the syntax:

```
local export documents in <COLUMN-NAME> to "<DIRECTORY>"
filename (automatic|column <COLUMN-NAME>) [actions <ACTION1> [, <ACTION2>]*]
```

The document contents are retrieved from a column and save in the specified directory. One output file is created per row. The name of the output files can be automatically generated or retrieved from another column.

The automatic generation process of file names tries to detect the MIME type of each document with its's associated extension. When it can not be determined, it uses 'txt' as extension. The documents are number sequentially.
Post-process actions can be specified. The supported actions are:

- **onerrorcontinue**: operation normally fails when an error occurs during data retrieval or storage. Operation continues in onerrorcontinue mode.
- **onerrorfail**: fail when an error occurs during data retrieval or storage.
- **extractzip**: consider the document to be a ZIP archive and extract it to a subfolder of the output folder named after the ZIP file name.

### 11.3.21 Memorize on Clipboard

The results of the last query can be memorized on a named clipboard using the syntax:

```
local memorize results clipboard NAME
```

### 11.3.22 Clear Results

The contents of a named clipboard can be cleared using the syntax:

```
local clear results clipboard NAME
```

### 11.3.23 Load Clipboard

The contents of a file in XML or JSON format can be loaded into a named clipboard using the syntax:

```
local load results clipboard <NAME> from "<DIRECTORY-OR-Filename>" format (xml|json) [compression level <DIGIT>]
```

### 11.3.24 Save Clipboard

The contents of a named clipboard can be saved in XML or JSON format to a file using the syntax:

```
local save results clipboard <NAME> to "<FILENAME>" format (xml|json) [compression level <DIGIT>]
```

### 11.3.25 Load Clipboard to Table

Data on a named clipboard can be inserted into a table using the syntax:

```
local insert results clipboard <NAME> in table <TABLE-NAME> [create]
```

By using 'create' the table will be created first.

### 11.3.26 Load Exact Online XML Files

Specifically on Exact Online databases you can upload pre-formatted XML upload files for Exact Online using the syntax:

```
local eol batch import xml "TOPIC-NAME" in "SOURCE-DIRECTORY-OR-FILE" success "TARGET-DIRECTORY-WHEN-PROCESSED" [fail "TARGET-DIRECTORY-WHEN-FAILED"]
```

This statement is deprecated. Please use the UploadXMLTopics table for more flexibility and improved throughput.

### 11.3.27 Diagnostics Statements

The following statements allow simple maintenance tasks to be scripted:

- **local preferences**: open the preferences window.
- **local enable event log**: enable event log logging.
- local configure license: open the license configuration window.
- local load license "FILENAME": load the license key stored in the file.
- local deploy static "DIRECTORY": (deprecated) deploy the software to a specific folder; only applies to pre-2019 ClickOnce-based releases.
- local diagnostics: open the diagnostics window.
- local keychain: open the keychain window.
- local garbage collection: run garbage collection.
- local data cache: open the data cache window.
- local help: open help window.
- local feedback: open feedback window.
- local optimize application: (deprecated) run the ngen application optimization; only applies to pre-2019 ClickOnce-based releases.

Security incidents

Security incidents: +31 88 00 26 598
Email: security@invantive.com
Opening hours: 9:00 - 17:00 CET Monday to Friday
Always include your telephone number, your e-mail address and a short description. Please do not give sensitive details until a secure communication channel has been established.

For urgent security incidents please send both an email outside of opening hours and call with number display on. You will be called back as soon as possible.

We use the threat matrix of NCSC to classify a reported incident. We use the Responsible Disclosure Guideline of NCSC as basis for our policy.

You will always receive a confirmation of receipt within 1 working day.

We ask you not to share information about the security incident with others until Invantine has had sufficient opportunity to resolve the problem and users have had sufficient opportunity to use a possibly updated version of the software. We ask you to not further use any knowledge of the security incident and to omit any actions made possible after the existence of the security problem.

If you are not satisfied with the handling, we would like to ask you to contact the NCSC.
