Despite all the care taken in the compilation of this text, neither the author nor the publisher can accept liability for any damage, which might result from any error, which might appear in this publication.

This manual is a reference guide intended to clarify usage. If data in the sample images match data in your system, the similarity is coincidental.

Important Safety and Usage Information

Intended Use and Limitations: This software, developed by Invantive, is designed to support a variety of business and information technology data processing functions, such as accounting, financial reporting and sales reporting. It is important to note that this software is not designed, tested, or approved for use in environments where malfunction or failure could lead to life-threatening situations or severe physical or environmental damage. This includes, but is not limited to:

- Nuclear facilities: The software should not be used for operations or functions related to the control, maintenance, or operation of nuclear facilities.
- Defense and Military Applications: This software is not suitable for use in defense-related applications, including but not limited to weapon control, military strategy planning, or any other aspects of national defense.
- Aviation: The software is not intended for use in the operation, navigation, or communication systems of any aircraft or air traffic control environments.
- Healthcare and Medicine Production: This software should not be utilized for medical device operation, patient data analysis for critical health decisions, pharmaceutical production, or medical research where its failure or malfunction could impact patient health.
- Chemical and Hazardous Material Handling: This software is not intended for the management, control, or operational aspects of chemical plants or hazardous material handling facilities. Any malfunction in software used in these settings could result in dangerous chemical spills, explosions, or environmental disasters.
- Transportation and Traffic Control Systems: The software should not be used for the control, operation, or management of transportation systems, including railway signal controls, subway systems, or traffic light management. Malfunctions in such critical systems could lead to severe accidents and endanger public safety.
- Energy Grid and Utility Control Systems: This software is not designed for the control or operation of energy grid systems, including electrical substations, renewable energy control systems, or water utility control systems. The failure of software in these areas could lead to significant power outages, water supply disruptions, or other public utility failures, potentially endangering communities and causing extensive damage.
- Other High-Risk Environments: Any other critical infrastructure and environments where a failure of the software could result in significant harm to individuals or the environment.

User Responsibility: Users must ensure that they understand the intended use of the software and refrain from deploying it in any setting that falls outside of its designed purpose. It is the responsibility of the user to assess the suitability of the software for their intended application, especially in any scenarios that might pose a risk to life, health, or the environment.

Disclaimer of Liability: Invantive disclaims any responsibility for damage, injury, or legal consequences resulting from the use or misuse of this software in prohibited or unintended applications.

1 SQL Driver for Outlook API

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the [user community](#). Invantive Support or other users will try to help you.

Microsoft Outlook data such as contacts and calendar items.

The Outlook driver covers 6 tables and 271 columns.

Outlook API Clients

Invantive UniversalSQL is available on many user interfaces ("clients" in traditional server-client paradigm). All Invantive UniversalSQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL.

Specifications

The SQL driver for Outlook supports partitioning: data from multiple companies are all listed together in one table. The value of the column indicates which company the data belongs to.

An introduction into the concepts of Invantive UniversalSQL such as databases, data containers and partitioning can be found in the [Invantive UniversalSQL grammar](#).

The configuration can be changed using various attributes from the database definition, on log on and during use. A full list of configuration options is listed in the [driver attributes](#).

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On Outlook the comparison of two texts is case sensitive by default.

Changes and bug fixes on the Outlook SQL driver can be found in the [release notes](#). Get access to the community through the [Outlook section](#) of the Invantive forums.

Driver code for use in settings.xml: Outlook

Alias: outlook

Recommended alias: olk

The Outlook instance currently running can be accessed on Microsoft Windows through COM.

Updated 30-05-2024 10:38 using Invantive UniversalSQL version 24.1.3-BETA+4689.

2 SQL Driver Attributes for Outlook API

The SQL driver for Outlook has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of Outlook or high volumes

of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The Outlook driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for Outlook can be found in the settings*.xml file used for the database. The reference manuals contain instructions how to relocate the settings*.xml files. Settings*.xml files are typically located in the %USERPROFILE%\invantive folder in most deployment scenarios. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The Outlook driver can be configured using the following attributes:

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
ignore-com-exception	Whether to ignore COM exceptions by default.	Outlook	False	✓	✓	✓	

3 Schema: Calendars

3.1 Tables

3.1.1 APPOINTMENTS: Outlook Appointments

Catalog: Outlook

Schema: Calendars

Primary Keys: EntryID

Label: Appointments

Documentation:

Outlook appointments.

Can retrieve data and change data using insert, update and delete.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function APPOINTMENTS. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
folderEntryId	string	<input type="checkbox"/>		Unique ID of the folder as a reference to the table 'FOLDERS'.
storeEntryId	string	<input type="checkbox"/>		Unique ID of a store as a reference to the table 'FOLDERS' when queried with include external stores.

Columns of Table Function

The columns of the table function APPOINTMENTS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert and update.

Name	Data Type	Label	Required	Documentation

5 Schema: General

5.1 Tables

5.1.1 FOLDERS: Outlook Folders

Catalog: Outlook

Schema: General

Primary Keys: EntryID

Label: Folders

Documentation:

Outlook folders.

This is a read-only table function. The Outlook API may not support changing the data or the Invantive UniversalSQL driver for Outlook does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Outlook API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function FOLDERS. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
ignoreComException	boolean	<input type="checkbox"/>	False	Whether to ignore COM exception during retrieval of data.
includeDefaultFolders	boolean	<input type="checkbox"/>	True	Whether to include default folders of the current user.
includeExternalStores	boolean	<input type="checkbox"/>	False	Whether to include external stores available to the session besides the current user.
includeSharedFolders	boolean	<input type="checkbox"/>	False	Whether to include shared folders available to the session besides the current user.

Columns of Table Function

The columns of the table function FOLDERS are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
AddressBookName	string(240)		<input type="checkbox"/>	
Class	string		<input checked="" type="checkbox"/>	
DefaultMessageClass	string		<input checked="" type="checkbox"/>	
Description	string		<input type="checkbox"/>	
DisplayName	string(240)		<input type="checkbox"/>

IsSharepointFolder	boolean		<input checked="" type="checkbox"/>	
Label	string(240)		<input checked="" type="checkbox"/>	
Name	string		<input checked="" type="checkbox"/>	
Position	int32		<input type="checkbox"/>	
SourceName	string		<input checked="" type="checkbox"/>	
SourceType	string(30)		<input checked="" type="checkbox"/>	
StoreID	string(1024)		<input checked="" type="checkbox"/>	
UnReadItemCount	int32		<input checked="" type="checkbox"/>	
WebView URL	string(240)		<input type="checkbox"/>	

5.1.2 SESSIONS: Outlook Sessions

Catalog: Outlook

Schema: General

Label: Sessions

Documentation:

Outlook sessions.

This is a read-only table function. The Outlook API may not support changing the data or the Invantive UniversalSQL driver for Outlook does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Outlook API.

Columns of Table Function

The columns of the table function SESSIONS are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
className	string(240)		<input checked="" type="checkbox"/>	
sessionAutoDiscoverConnectionMode	string(240)		<input type="checkbox"/>	
sessionAutoDiscoverXml	string		<input type="checkbox"/>	
sessionCurrentProfileName	string(240)		<input checked="" type="checkbox"/>	
sessionCurrentUserAddress	string(240)		<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
sessionCurrentUserName	string(240)		<input type="checkbox"/>	
sessionDefaultStoreId	string(1024)		<input type="checkbox"/>	
sessionExchangeConnectionMode	string(240)		<input type="checkbox"/>	
sessionExchangeMailboxServerName	string(240)		<input type="checkbox"/>	
sessionExchangeMailboxServerVersion	string(240)		<input type="checkbox"/>	
sessionOffline	boolean		<input checked="" type="checkbox"/>	
sessionType	string(240)		<input type="checkbox"/>	

5.1.3 STORES: Outlook Stores

Catalog: Outlook

Schema: General

Primary Keys: StoreID

Label: Stores

Documentation:

Outlook stores.

This is a read-only table function. The Outlook API may not support changing the data or the Invantive UniversalSQL driver for Outlook does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Outlook API.

Columns of Table Function

The columns of the table function STORES are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
ClassName	string(240)		<input checked="" type="checkbox"/>	
DefaultMapiFolderCalendarEntryId	string(1024)		<input type="checkbox"/>	
DefaultMapiFolderCalendarFullPath	string(240)		<input type="checkbox"/>	
DisplayName	string(240)		<input checked="" type="checkbox"/>	
FilePath	string(240)		<input type="checkbox"/>	
IsCachedExchange	boolean		<input checked="" type="checkbox"/>	
IsConversationEnabled	boolean		<input checked="" type="checkbox"/>	
IsDataFileStore	boolean		<input checked="" type="checkbox"/>	
IsDefaultStore	boolean		<input checked="" type="checkbox"/>	
IsInstantSearchEnabled	boolean		<input checked="" type="checkbox"/>	
IsOpen	boolean		<input checked="" type="checkbox"/>	
RootMapiFolderEntryId	string(1024)		<input type="checkbox"/>	
RootMapiFolderFullFolderPath	string(240)		<input type="checkbox"/>	
StoreID	string(1024)		<input checked="" type="checkbox"/>	
TypeCode	string(240)		<input checked="" type="checkbox"/>	

6 Schema: Mails

6.1 Tables

6.1.1 MAILS: Outlook Mails

Catalog: Outlook

Schema: Mails

Primary Keys: EntryID

Label: Mails

Documentation:

Outlook mails.

Can retrieve data and change data using insert, update and delete.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function MAILS. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
folderEntryId	string	<input type="checkbox"/>		Unique ID of the folder as a reference to the table 'FOLDERS'.
storeEntryId	string	<input type="checkbox"/>		Unique ID of a store as a reference to the table 'FOLDERS' when queried with include external stores.

Columns of Table Function

The columns of the table function MAILS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert and update.
