## Belangrijke Informatie over Veiligheid en Gebruik

Beoogd gebruik en beperkingen: Deze software, ontwikkeld door Invantive, is ontworpen om een verscheidenheid aan zakelijke en informatietechnologische gegevensverwerkingsfuncties te ondersteunen, zoals boekhouding, financiële rapportage en verkooprapportage. Het is belangrijk om op te merken dat deze software niet is ontworpen, getest of goedgekeurd voor gebruik in omgevingen waar een storing of defect kan leiden tot levensbedreigende situaties, ernstige fysieke schade of milieuschade. Dit omvat, maar is niet beperkt tot:

- Nucleaire faciliteiten: de software mag niet worden gebruikt voor operaties of functies die verband houden met de controle, het onderhoud of de werking van nucleaire faciliteiten.
- Defensie en militaire toepassingen: deze software is niet geschikt voor gebruik in defensiegerelateerde toepassingen, inclusief maar niet beperkt tot wapenbeheer, militaire strategieplanning of andere aspecten van nationale defensie.
- Luchtvaart: de software is niet bedoeld voor gebruik in de bediening, navigatie of communicatiesystemen van vliegtuigen of luchtverkeersleidingomgevingen.
- Gezondheidszorg en medicijnproductie: deze software mag niet worden gebruikt voor de werking van medische apparaten, de analyse van patiëntgegevens voor kritieke gezondheidsbeslissingen, farmaceutische productie of medisch onderzoek waarbij een storing of defect de gezondheid van de patiënt kan beïnvloeden.
- Verwerking van chemische en/of gevaarlijke stoffen: deze software is niet bedoeld voor het beheer, de controle of de operationele aspecten van chemische fabrieken of faciliteiten voor de verwerking van chemische en/of gevaarlijke stoffen. Elke storing in de software die in deze omgevingen wordt gebruikt kan leiden tot gevaarlijke chemische lozingen, explosies of milieurampen.
- Transport- en verkeerscontrolesystemen: de software mag niet worden gebruikt voor de besturing, bediening of het beheer van transportsystemen, waaronder de besturing van spoorwegsignalen, metrosystemen of verkeerslichten. Storingen in dergelijke kritieke systemen kunnen tot ernstige ongelukken leiden en de openbare veiligheid in gevaar brengen.
- Energienetwerk- en nutsbesturingssystemen: deze software is niet ontworpen voor de besturing of bediening van energienetwerksystemen, waaronder elektrische onderstations, besturingssystemen voor hernieuwbare energie of besturingssystemen van waternutsbedrijven. Het falen van software op deze gebieden kan leiden tot aanzienlijke stroomonderbrekingen, onderbrekingen in de watervoorziening of andere storingen in openbare voorzieningen, waardoor gemeenschappen in gevaar kunnen komen en grote schade kan worden aangericht.
- Andere omgevingen met een hoog risico: alle andere kritieke infrastructuren en omgevingen waar een storing in de software kan leiden tot aanzienlijke schade aan personen of het milieu.

Gebruikersverantwoordelijkheid: gebruikers moeten ervoor zorgen dat ze het beoogde gebruik van de software begrijpen en de software niet gebruiken in een omgeving die buiten het beoogde doel valt. Het is de verantwoordelijkheid van de gebruiker om de geschiktheid van de software voor de beoogde toepassing te beoordelen, vooral in scenario's die een risico kunnen vormen voor leven, gezondheid en/of milieu.

Afwijzing van aansprakelijkheid: Invantive wijst elke verantwoordelijkheid af voor schade, letsel of wettelijke gevolgen die voortvloeien uit het gebruik of misbruik van deze software in verboden en/of onbedoelde toepassingen.

## 1 SQL Driver for Robaws API

Invantive SQL is the fastest, easiest and most reliable way to exchange data with the Robaws API.

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the [user community](#). Other users or Invantive Support will try to help you to our best.

Robaws is cloud software. Robaws helps construction companies manage their business.

The Robaws driver covers 209 tables and 85895 columns.

### Robaws API Clients

Invantive SQL is available on many user interfaces ("clients" in traditional server-client paradigm). All Invantive SQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

The [Robaws Power BI connector](#) is based on the Invantive SQL driver for Robaws, completed by a high-performance OData connector which works straight on Power BI without any add-on. The OData protocol is always version 4, independent whether the backing platform uses OData, SOAP or another protocol.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL. High-volume replication of data taken from the Robaws API into traditional databases such as SQL Server (on-premise and Azure), MySQL, PostgreSQL and Oracle is possible using [Invantive Data Replicator](#). Invantive Data Replicator automatically creates and maintains Robaws datawarehouses, possibly in combination with data from over 70 other (cloud) platforms. Data Replicator supports data volumes up to over 1 TB and over 5.000 companies. The on-premise edition of Invantive Bridge offers an Robaws ADO.net provider.

Finally, online web apps can be build for Robaws using App Online of [Invantive Cloud](#).

### Monitor API Calls

When a query or DML-statement has been executed on Invantive SQL a developer can evaluate the actual calls made to the Robaws API using a query on `sessionios@DataDictionary`. As an alternative, extensive request and response logging can be enabled by setting `log-native-calls-to-disk` to true. In the `%USERPROFILE%\Invantive\NativeLog` folder Invantive SQL will create log files per API request and response.

### Specifications

The SQL driver for Robaws does not support partitioning. Define one data container in a database for each company in Robaws to enable parallel access for data from multiple companies.

An introduction into the concepts of Invantive SQL such as databases, data containers and partitioning can be found in the [Invantive SQL grammar](#).

The configuration can be changed using various attributes during log on and use. A full list of configuration options is listed in the [driver attributes](#) [ 2 ].

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On Robaws the comparison of two texts is case sensitive by default.

Changes and bug fixes on the Robaws SQL driver can be found in the [release notes](#). Get access to the Robaws community through the [Robaws section](#) of the Invantive forums.

## 2 SQL Driver Attributes for Robaws API

The SQL driver for Robaws has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of Robaws or high-volumes of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The Robaws driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings\*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Drivers file: the providers.xml file (obsolete starting release 17.32).
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for Robaws can be found in the settings\*.xml file used for the database. Settings\*.xml files are typically located in the %USERPROFILE%\invantive folder in most deployment scenarios. The reference manuals contain instructions how to relocate the settings\*.xml files. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after

execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The Robaws driver can be configured using the following attributes:

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
add-odata-mandatory-filters	Whether to automatically add OData filters deemed necessary by the platform.	OData	False	✓	✓	✓

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ArticleSuppliers`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `BankPayments`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

### Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `ClaimStates`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EmployeeRoles`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EmployeeBenefits`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

### 16.1.5 EmployeeCertificates: Robaws Employee Certificates

Search

Catalog: Robaws

Schema: Employees

Label: Employee Certificates

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/employees`

Insert Robaws API URL: `/api/v2/employees`

Update Robaws API URL: `/api/v2/employees`

Delete Robaws API URL: `/api/v2/employees`

Field Selection Method: NotRequired

Base Path: `items[*].certificates[*]`

Select Robaws API Operation: `get /api/v2/employees`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EmployeeCertificates`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Field Selection Method: NotRequired

Base Path: `items[*]`

Select Robaws API Operation: `get /api/v2/employees`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `Employees`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `GeneralLedgerAccounts`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/materials/{id}/comments`

Insert Robaws API URL: `/api/v2/materials/{id}/comments`

Update Robaws API URL: `/api/v2/materials/{id}/comments`

Delete Robaws API URL: `/api/v2/materials/{id}/comments`

Field Selection Method: NotRequired

Select Robaws API Operation: `get /api/v2/materials/{id}/comments`

### Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `Materials`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

## 21 Schema: Native

### 21.1 Tables

#### 21.1.1 NATIVEPLATFORMSCALARREQUESTS: Robaws Native Platform Scalar Requests

Direct access to native API.

Catalog: Robaws

Schema: Native

Alias: npt

Label: Native Platform Scalar Requests

Documentation:

The NativePlatformScalarRequests table provides direct access to the native API protocol over an established connection to the Robaws API server. It will contain a new row for every row inserted with a native API request in PAYLOAD\_TEXT with the results of unaltered forwarding of the payload to the Robaws API server.

Retrieve: true

Insert: true

Update: false

Delete: false

## View Columns

The columns of the view NATIVEPLATFORMSCALARREQUESTS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

## 22 Schema: OfferLineItems

### 22.1 Tables

#### 22.1.1 OfferCalculationLineIdsByOfferId

Find one

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Field Selection Method: NotRequired

Base Path: `calculationLineItems[*]`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items/{id}`

### 22.1.2 OfferCalculationLinesByOfferId

Find all

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Field Selection Method: NotRequired

Base Path: `items[*].calculationLineItems[*]`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items`

### 22.1.3 OfferLineItemsByOfferId: Robaws Offer Line Items by Offer ID

Find all

Catalog: Robaws

Schema: OfferLineItems

Label: Offer Line Items by Offer ID

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Field Selection Method: NotRequired

Base Path: `items[*]`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items`

#### 22.1.4 OfferLinesByOfferId

Find one

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Field Selection Method: `NotRequired`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items/{id}`

## Table Function Columns

The columns of the table function `OfferLinesByOfferId` are shown below. Each column has an SQL data type.

### 22.1.5 OfferParameterIdsByOfferId

Find one

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Field Selection Method: NotRequired

Base Path: parameters [ \* ]

Select Robaws API Operation: get /api/v2/offers/{offerId}/line-items/{id}

### 22.1.6 OfferParameterLinesByOfferId

Find all

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items`

Field Selection Method: NotRequired

Base Path: `items[*].parameters[*]`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items`

## Table Function Columns

The columns of the table function `OfferParameterLinesByOfferId` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
<code>agreementType</code>	string	Agreement Type	<input type="checkbox"/>	
<code>archivedAt</code>	datetime		<input type="checkbox"/>	
<code>article_archivedAt</code>	datetime		<input type="checkbox"/>

### 22.1.7 OfferParameterPossibleValueLineIdsByOfferId

Find one

Catalog: Robaws

Schema: OfferLineItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Insert Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Update Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Delete Robaws API URL: `/api/v2/offers/{offerId}/line-items/{id}`

Field Selection Method: NotRequired

Base Path: `parameters[*].possibleValues[*]`

Select Robaws API Operation: `get /api/v2/offers/{offerId}/line-items/{id}`

## Table Function Columns

## 23 Schema: Offers

### 23.1 Tables

#### 23.1.1 OfferById: Robaws Offer by ID

Find one

Catalog: Robaws

Schema: Offers

Label: Offer by ID

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}`

Insert Robaws API URL: `/api/v2/offers/{id}`

Update Robaws API URL: `/api/v2/offers/{id}`

Delete Robaws API URL: `/api/v2/offers/{id}`

Field Selection Method: NotRequired

Select Robaws API Operation: `get /api/v2/offers/{id}`

### 23.1.5 OfferLineItemParametersByOfferId

Find one

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}`

Insert Robaws API URL: `/api/v2/offers/{id}`

Update Robaws API URL: `/api/v2/offers/{id}`

Delete Robaws API URL: `/api/v2/offers/{id}`

Field Selection Method: NotRequired

Base Path: `lineItems[*].parameters[*]`

Select Robaws API Operation: `get /api/v2/offers/{id}`

## Table Function Columns

The columns of the table function `OfferLineItemParametersByOfferId` are shown below. Each column has an SQL data type.

### 23.1.6 OfferLines

Search

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers`

Insert Robaws API URL: `/api/v2/offers`

Update Robaws API URL: `/api/v2/offers`

Delete Robaws API URL: `/api/v2/offers`

Field Selection Method: `NotRequired`

Base Path: `items[*].lineItems[*]`

Select Robaws API Operation: `get /api/v2/offers`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `OfferLines`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

### 23.1.7 OfferLinesByOfferId

Find one

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}`

Insert Robaws API URL: `/api/v2/offers/{id}`

Update Robaws API URL: `/api/v2/offers/{id}`

Delete Robaws API URL: `/api/v2/offers/{id}`

Field Selection Method: NotRequired

Base Path: `lineItems[*]`

Select Robaws API Operation: `get /api/v2/offers/{id}`

## Table Function Columns

The columns of the table function `OfferLinesByOfferId` are shown below. Each column has an SQL data type.

### 23.1.8 OfferParameterPossibleValuesByOfferId

Find one

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}`

Insert Robaws API URL: `/api/v2/offers/{id}`

Update Robaws API URL: `/api/v2/offers/{id}`

Delete Robaws API URL: `/api/v2/offers/{id}`

Field Selection Method: `NotRequired`

Base Path: `parameters[*].possibleValues[*]`

Select Robaws API Operation: `get /api/v2/offers/{id}`

### 23.1.9 OfferParameters

Search

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers`

Insert Robaws API URL: `/api/v2/offers`

Update Robaws API URL: `/api/v2/offers`

Delete Robaws API URL: `/api/v2/offers`

Field Selection Method: `NotRequired`

Base Path: `items[*].parameters[*]`

Select Robaws API Operation: `get /api/v2/offers`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `OfferParameters`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

### 23.1.10 OfferParametersByOfferId

Find one

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}`

Insert Robaws API URL: `/api/v2/offers/{id}`

Update Robaws API URL: `/api/v2/offers/{id}`

Delete Robaws API URL: `/api/v2/offers/{id}`

Field Selection Method: NotRequired

Base Path: `parameters[*]`

Select Robaws API Operation: `get /api/v2/offers/{id}`

## Table Function Columns

### 23.1.11 OfferPdfsByOfferId

Generate PDF

Catalog: Robaws

Schema: Offers

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/offers/{id}/pdf`

Insert Robaws API URL: `/api/v2/offers/{id}/pdf`

Update Robaws API URL: `/api/v2/offers/{id}/pdf`

Delete Robaws API URL: `/api/v2/offers/{id}/pdf`

Field Selection Method: `NotRequired`

Select Robaws API Operation: `get /api/v2/offers/{id}/pdf`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `OfferPdfsByOfferId`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Robaws

Schema: PaymentConditions

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/payment-conditions/{id}`

Insert Robaws API URL: `/api/v2/payment-conditions/{id}`

Update Robaws API URL: `/api/v2/payment-conditions/{id}`

Delete Robaws API URL: `/api/v2/payment-conditions/{id}`

Field Selection Method: NotRequired

Select Robaws API Operation: `get /api/v2/payment-conditions/{id}`

## Table Function Columns

The columns of the table function `PaymentConditionById` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
<code>archivedAt</code>	<code>datetime</code>		<input type="checkbox"/>	
<code>createdAt</code>	<code>datetime</code>		<input type="checkbox"/>

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `PaymentConditions`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select \* from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: Robaws

Schema: PlanningItems

This is a read-only table. The Robaws API may not support changing the data or the Invantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/planning-items/{id}/documents`

Insert Robaws API URL: `/api/v2/planning-items/{id}/documents`

Update Robaws API URL: `/api/v2/planning-items/{id}/documents`

Delete Robaws API URL: `/api/v2/planning-items/{id}/documents`

Field Selection Method: NotRequired

Select Robaws API Operation: `get /api/v2/planning-items/{id}/documents`

### 25.1.4 PlanningEmployeeIds

Search

Catalog: Robaws

Schema: PlanningItems

This is a read-only table function. The Robaws API may not support changing the data or the Invantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/planning-items`

Insert Robaws API URL: `/api/v2/planning-items`

Update Robaws API URL: `/api/v2/planning-items`

Delete Robaws API URL: `/api/v2/planning-items`

Field Selection Method: NotRequired

Base Path: `items[*].employeeIds[*]`

Select Robaws API Operation: `get /api/v2/planning-items`

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `PlanningEmployeeIds`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be treated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example with ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

### 25.1.5 PlanningEmployeeIdsByPlanningId

Find one

Catalog: Robaws

Schema: PlanningItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/planning-items/{id}`

Insert Robaws API URL: `/api/v2/planning-items/{id}`

Update Robaws API URL: `/api/v2/planning-items/{id}`

Delete Robaws API URL: `/api/v2/planning-items/{id}`

Field Selection Method: NotRequired

Base Path: `employeeIds[*]`

Select Robaws API Operation: `get /api/v2/planning-items/{id}`

## Table Function Columns

The columns of the table function `PlanningEmployeeIdsByPlanningId` are shown below. Each column has an SQL data type.

### 25.1.6 PlanningEmployeeOtherCertificatesByPlanningId

Find one

Catalog: Robaws

Schema: PlanningItems

This is a read-only table function. The Robaws API may not support changing the data or the Invariantive SQL driver for Robaws does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Robaws API.

Select Robaws API URL: `/api/v2/planning-items/{id}`

Insert Robaws API URL: `/api/v2/planning-items/{id}`

Update Robaws API URL: `/api/v2/planning-items/{id}`

Delete Robaws API URL: `/api/v2/planning-items/{id}`

Field Selection Method: NotRequired

Base Path: `employees[*].otherCertificates[*]`

Select Robaws API Operation: `get /api/v2/planning-items/{id}`
