Important Safety and Usage Information

Intended Use and Limitations: This software, developed by Invantive, is designed to support a variety of business and information technology data processing functions, such as accounting, financial reporting and sales reporting. It is important to note that this software is not designed, tested, or approved for use in environments where malfunction or failure could lead to life-threatening situations or severe physical or environmental damage. This includes, but is not limited to:

- Nuclear facilities: The software should not be used for operations or functions related to the control, maintenance, or operation of nuclear facilities.
- Defense and Military Applications: This software is not suitable for use in defense-related applications, including but not limited to weaponry control, military strategy planning, or any other aspects of national defense.
- Aviation: The software is not intended for use in the operation, navigation, or communication systems of any aircraft or air traffic control environments.
- Healthcare and Medicine Production: This software should not be utilized for medical device operation, patient data analysis for critical health decisions, pharmaceutical production, or medical research where its failure or malfunction could impact patient health.
- Chemical and Hazardous Material Handling: This software is not intended for the management, control, or operational aspects of chemical plants or hazardous material handling facilities. Any malfunction in software used in these settings could result in dangerous chemical spills, explosions, or environmental disasters.
- Transportation and Traffic Control Systems: The software should not be used for the control, operation, or management of transportation systems, including railway signal controls, subway systems, or traffic light management. Malfunctions in such critical systems could lead to severe accidents and endanger public safety.
- Energy Grid and Utility Control Systems: This software is not designed for the control or operation of energy grid systems, including electrical substations, renewable energy control systems, or water utility control systems. The failure of software in these areas could lead to significant power outages, water supply disruptions, or other public utility failures, potentially endangering communities and causing extensive damage.
- Other High-Risk Environments: Any other critical infrastructure and environments where a failure of the software could result in significant harm to individuals or the environment.

User Responsibility: Users must ensure that they understand the intended use of the software and refrain from deploying it in any setting that falls outside of its designed purpose. It is the responsibility of the user to assess the suitability of the software for their intended application, especially in any scenarios that might pose a risk to life, health, or the environment.

Disclaimer of Liability: Invantive disclaims any responsibility for damage, injury, or legal consequences resulting from the use or misuse of this software in prohibited or unintended applications.

1 SQL Driver for StackExchange API

Invantive SQL is the fastest, easiest and most reliable way to exchange data with the StackExchange API.

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the [user community](#). Other users or Invantive Support will try to help you to our best.

StackExchange is online collaboration software. Most popular variant is StackOverflow which is used by millions of software developers globally.

The StackExchange driver covers 21 tables and 718 columns.

StackExchange API Clients

Invantive SQL is available on many user interfaces ("clients" in traditional server-client paradigm). All Invantive SQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL. High-volume replication of data taken from the StackExchange API into traditional databases such as SQL Server (on-premise and Azure), MySQL, PostgreSQL and Oracle is possible using [Invantive Data Replicator](#). Invantive Data Replicator automatically creates and maintains StackExchange datawarehouses, possibly in combination with data from over 70 other (cloud) platforms. Data Replicator supports data volumes up to over 1 TB and over 5.000 companies. The on-premise edition of Invantive Bridge offers an StackExchange ADO.net provider.

Monitor API Calls

When a query or DML-statement has been executed on Invantive SQL a developer can evaluate the actual calls made to the StackExchange API using a query on sessionios@DataDictionary. As an alternative, extensive request and response logging can be enabled by setting log-native-calls-to-disk to true. In the %USERPROFILE%\Invantive\NativeLog folder Invantive SQL will create log files per API request and response.

Specifications

The SQL driver for StackExchange supports partitioning: data from multiple companies are all listed together in one table. The value of the column indicates which company the data belongs to.

An introduction into the concepts of Invantive SQL such as databases, data containers and partitioning can be found in the [Invantive SQL grammar](#).

The configuration can be changed using various attributes during log on and use. A full list of configuration options is listed in the [driver attributes](#) ².

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On StackExchange the comparison of two texts is case sensitive by default.

Changes and bug fixes on the StackExchange SQL driver can be found in the [release notes](#). There is currently no specific section on the [Invantive forums](#) for StackExchange. Please reach out to other users of StackExchange by leaving a question or contact request.

Driver code for use in settings.xml: `StackExchange`

Alias: `StackExchange`

Recommended alias: `sx`

Partition Label: `Site`

More technical documentation as provided by the supplier of the StackExchange API on the native APIconnection used can be found at <https://api.stackexchange.com>.

General documentation on StackExchange is available at <https://stackexchange-apps.com>

Updated: 15-06-2022 22:37 using Invantive SQL version 22.1.46-BETA+3385.

2 SQL Driver Attributes for StackExchange API

The SQL driver for StackExchange has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of StackExchange or high-volumes of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The StackExchange driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Drivers file: the providers.xml file (obsolete starting release 17.32).
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for StackExchange can be found in the settings*.xml file used for the database. Settings*.xml files are typically located in the %USERPROFILE%\invantive folder in most deployment scenarios. The reference manuals contain instructions how to relocate the settings*.xml files. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The StackExchange driver can be configured using the following attributes:

| Code | Description | Origin | Default Value | Set from Connection String | Set from Set SQL-Statement | Set from Driver's File | Set from Log On |
|---------------------------------|---|--------|---------------|----------------------------|----------------------------|------------------------|-----------------|
| add-odata-mandatory-filters | Whether to automatically add OData filters deemed necessary by the platform. | OData | False | ✓ | ✓ | ✓ | |
| analysis-enforce-row-uniqueness | Use for analysis only! Enforce rows to be unique. | Shared | False | ✓ | ✓ | ✓ | |
| api-access-token | Access Token is a security token for multiple OAuth2 Flows. With an Access Token you can access protected resources. An Access Token must be stored securely since once compromised allows access to your protected resources. | OData | | ✓ | | ✓ | ✓ |
| api-client-id | The client ID is a unique identifier of your application. It is generated by registering an application. | OData | | ✓ | | ✓ | ✓ |
| api-client-secret | The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access. | OData | | ✓ | | ✓ | ✓ |
| api-pre-expiry-refresh-sec | The number of seconds before the token expires to acquire a new token. | OData | | ✓ | ✓ | ✓ | |
| api-redirect-url | The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed. | OData | | ✓ | | ✓ | ✓ |
| api-refresh-token | Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources. | OData | | ✓ | | ✓ | ✓ |
| api-scope | The scope to request an OAuth token for. | OData | | ✓ | | ✓ | |
| api-token-url | The token URI is the OAuth2 endpoint to exchange tokens. | OData | | ✓ | | ✓ | |
| api-url | URL to access the API. | OData | | ✓ | | ✓ | |

3.1 Tables

3.1.1 NATIVEPLATFORMSCALARREQUESTS: StackExchange Native Platform Scalar Requests

Direct access to native API.

Catalog: StackExchange

Schema: Native

Alias: npt

Label: Native Platform Scalar Requests

Documentation:

The NativePlatformScalarRequests table provides direct access to the native API protocol over an established connection to the StackExchange API server. It will contain a new row for every row inserted with a native API request in PAYLOAD_TEXT with the results of unaltered forwarding of the payload to the StackExchange API server.

Retrieve: true

Insert: true

Update: false

Delete: false

View Columns

The columns of the view NATIVEPLATFORMSCALARREQUESTS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

| Name | Data Type | Label | Required | Documentation |
