Important Safety and Usage Information

Intended Use and Limitations: This software, developed by Invantive, is designed to support a variety of business and information technology data processing functions, such as accounting, financial reporting and sales reporting. It is important to note that this software is not designed, tested, or approved for use in environments where malfunction or failure could lead to life-threatening situations or severe physical or environmental damage. This includes, but is not limited to:

- Nuclear facilities: The software should not be used for operations or functions related to the control, maintenance, or operation of nuclear facilities.
- Defense and Military Applications: This software is not suitable for use in defense-related applications, including but not limited to weaponry control, military strategy planning, or any other aspects of national defense.
- Aviation: The software is not intended for use in the operation, navigation, or communication systems of any aircraft or air traffic control environments.
- Healthcare and Medicine Production: This software should not be utilized for medical device operation, patient data analysis for critical health decisions, pharmaceutical production, or medical research where its failure or malfunction could impact patient health.
- Chemical and Hazardous Material Handling: This software is not intended for the management, control, or operational aspects of chemical plants or hazardous material handling facilities. Any malfunction in software used in these settings could result in dangerous chemical spills, explosions, or environmental disasters.
- Transportation and Traffic Control Systems: The software should not be used for the control, operation, or management of transportation systems, including railway signal controls, subway systems, or traffic light management. Malfunctions in such critical systems could lead to severe accidents and endanger public safety.
- Energy Grid and Utility Control Systems: This software is not designed for the control or operation of energy grid systems, including electrical substations, renewable energy control systems, or water utility control systems. The failure of software in these areas could lead to significant power outages, water supply disruptions, or other public utility failures, potentially endangering communities and causing extensive damage.
- Other High-Risk Environments: Any other critical infrastructure and environments where a failure of the software could result in significant harm to individuals or the environment.

User Responsibility: Users must ensure that they understand the intended use of the software and refrain from deploying it in any setting that falls outside of its designed purpose. It is the responsibility of the user to assess the suitability of the software for their intended application, especially in any scenarios that might pose a risk to life, health, or the environment.

Disclaimer of Liability: Invantive disclaims any responsibility for damage, injury, or legal consequences resulting from the use or misuse of this software in prohibited or unintended applications.

1 SQL Driver for Teamleader Focus API

Invantive UniversalSQL is the fastest, easiest and most reliable way to exchange data with the Teamleader Focus API.

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the [user community](#). Invantive Support or other users will try to help you.

Teamleader Focus is a cloud solution for customer management. Teamleader includes CRM as well as project and tickets. Teamleader can be extended by defining custom fields on several core concepts.

The Teamleader Focus driver covers 314 tables and 5086 columns.

Teamleader Focus API Clients

Invantive UniversalSQL is available on many user interfaces ("clients" in traditional server-client paradigm). All Invantive UniversalSQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

The [Teamleader Focus Power BI connector](#) is based on the Invantive UniversalSQL driver for Teamleader Focus, completed by a high-performance OData connector which works straight on Power BI without any add-on. The OData protocol is always version 4, independent whether the backing platform uses OData, SOAP or another protocol.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL. High-volume replication of data taken from the Teamleader Focus API into traditional databases such as SQL Server (on-premises and Azure), MySQL, PostgreSQL and Oracle is possible using [Invantive Data Replicator](#). Invantive Data Replicator automatically creates and maintains Teamleader Focus datawarehouses, possibly in combination with data from over 75 other (cloud) platforms. Invantive Data Replicator supports data volumes up to over 1 TB and over 5.000 companies. The on-premise edition of Invantive Bridge offers an Teamleader Focus ADO.net provider.

Finally, online web apps can be build for Teamleader Focus using App Online of [Invantive Cloud](#).

Monitor API Calls

When a query or DML-statement has been executed on Invantive UniversalSQL a developer can evaluate the actual calls made to the Teamleader Focus API using a query on sessionios@DataDictionary. As an alternative, extensive request and response logging can be enabled by setting log-native-calls-to-disk to true. In the %USERPROFILE%\Invantive\NativeLog folder Invantive UniversalSQL will create log files per Teamleader Focus API request and response.

Specifications

The SQL driver for Teamleader Focus does not support partitioning. Define one data container in a database for each company in Teamleader Focus to enable parallel access for data from multiple companies.

An introduction into the concepts of Invantive UniversalSQL such as databases, data containers and partitioning can be found in the [Invantive UniversalSQL grammar](#).

The configuration can be changed using various attributes from the database definition, on log on and during use. A full list of configuration options is listed in the [driver attributes](#).

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On Teamleader Focus the comparison of two texts is case sensitive by default.

Changes and bug fixes on the Teamleader Focus SQL driver can be found in the [release notes](#). Get access to the community through the [Teamleader Focus section](#) of the Invantive forums.

Driver code for use in settings.xml: `Teamleader`

Alias: `teamleader`

Recommended alias: `t1r`

Driver code for use in settings.xml

Alternative NameTeamleader Focus is also popular by the former name Teamleader. Authentication for the Teamleader Focus API can be done using one of the following two alternatives: 1. Using the user log on code and password also used on the Teamleader website. 2. Using an API group and API secret. Authentication using user log on code and password is recommended for general use of the API through the Invantive tables. The user must have access to all functionality since by default all so-called 'scopes' of the API are requested. The API scopes can be manually entered to be able to log in with a restricted accounts. Please provide a space-separated list chosen from companies contacts deals departments events invoices products projects quotations subscriptions tickets todos users. The API group and secret can be found on https://app.teamleader.eu/apiwebhooks.php?show_key.

Usage LimitsInvantive SQL executes API calls to retrieve and upload data from the Teamleader Focus API in JSON format. The number of V1 API calls allowed per 5 seconds is 25 and the V2 API allows 200 calls per minute. Invantive SQL ensures that within your session the number of calls allowed per timewindow is not exceeded. To get an impression of how Invantive SQL translates into API calls, please query the data dictionary view 'sessionios', such as with 'select * from sessionios@datadictionary'.

Custom FieldsCustom fields for which one value can be entered on an object are added to the table representing the object. For instance, a custom field 'needsaudit' on 'project', will be added as a column 'c_needsaudit' on the 'project' table. The name of the additional column directly derives from the custom field name. Almost all changes, including adding numbers or reading characters, will result in the data model being changed. Custom fields which can have no, one or multiple values ('set' custom fields) are reflected in the data model by tables with a name constructed of the object name, an underscore plus the name of the custom field. For example, a custom field named 'Multiple Selection' on 'Task' will add a table 'task_multipleselection' to the data model. Custom fields are unique to each Teamleader Focus environment. When the existence of specific custom field is not guaranteed, please use generic solutions like the tables 'CustomFieldDefinitions', 'custom_fields', 'custom_field_options', 'custom_field', 'Custom_Fields_All', 'Custom_Field_Types' and their object-specific custom field value tables like 'ticket_custom_field_values_by_id'.

Updated 10-06-2024 18:37 using Invantive UniversalSQL version 24.1.3-BETA+4689.

2 SQL Driver Attributes for Teamleader Focus API

The SQL driver for Teamleader Focus has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of Teamleader Focus or high volumes of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The Teamleader Focus driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for Teamleader Focus can be found in the settings*.xml file used for the database. The reference manuals contain instructions how to relocate the settings*.xml files. Settings*.xml files are typically located in the %USERPROFILE%\invantive folder in most deployment scenarios. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The Teamleader Focus driver can be configured using the following attributes:

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
add-odata-mandatory-filters	Whether to automatically add OData filters deemed necessary by the platform.	OData	False	✓	✓	✓	
analysis-enforce-row-uniqueness	Enforce rows to be unique for software analysis. A fingerprint is calculated from the whole row of data when the primary key column is unknown.	Shared	False	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
api-access-token	Access Token is a security token for multiple OAuth2 Flows. With an Access Token you can access protected resources. An Access Token must be stored securely since once compromised allows access to your protected resources.	OData		✓	✓	✓	✓
api-client-id	The client ID is a unique identifier of your application. It is generated by registering an application.	OData		✓		✓	✓
api-client-secret	The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.	OData		✓		✓	✓
api-group-authentication	Use API group authentication when true. OAuth otherwise.	Teamleader Focus		✓		✓	
api-pre-expiry-refresh-sec	The number of seconds before the token expires to acquire a new token.	OData		✓	✓	✓	
api-redirect-url	The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.	OData		✓		✓	✓
api-refresh-token	Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources.	OData		✓		✓	✓
api-scope	The authorization scope(s) to request an OAuth token for.	OData		✓		✓	
api-token-url	The token URI is the OAuth2 endpoint to exchange tokens with.	OData		✓		✓	
api-url	URL of web service.	OData		✓		✓	
bulk-delete-page-size-rows	Number of rows to delete per batch when bulk deleting.	Shared	10000	✓	✓	✓	
bulk-insert-page-size-bytes	Approximate maximum size in bytes of batch when bulk inserting.	Shared	10000000	✓	✓	✓	
bulk-insert-page-size-rows	Number of rows to insert per batch when bulk inserting.	Shared	250	✓	✓	✓	
download-error-400-bad-request-max-tries	Maximum number of tries when HTTP server reports bad format during retrieval of data.		3	✓	✓	✓

http-memory-cache-compression-level	Compression level for the HTTP memory cache, ranging from 1 (little) to 9 (intense). Default is 5.	OData	5	✓	✓	✓	
http-memory-cache-max-age-sec	Maximum acceptable age in seconds for use of data in the HTTP memory cache.	OData	14400	✓	✓	✓	
http-post-timeout-max-ms	HTTP POST maximum timeout on retry (ms).		58000	✓	✓	✓	
http-post-timeout-ms	HTTP POST timeout (ms).		57000	✓	✓	✓	
ignore-http-400-errors	Ignore HTTP 400 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
ignore-http-401-errors	Ignore HTTP 401 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-402-errors	Ignore HTTP 402 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-403-errors	Ignore HTTP 403 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-404-errors	Ignore HTTP 404 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-422-errors	Ignore HTTP 422 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-429-errors	Ignore HTTP 429 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-500-errors	Ignore HTTP 500 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-502-errors	Ignore HTTP 502 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-503-errors	Ignore HTTP 503 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
invalid-json-on-get-max-tries	Maximum number of tries when the JSON received on GET is invalid.		1	✓	✓	✓	
invalid-json-on-get-sleep-initial-ms	Initial sleep in milliseconds between retries when the JSON received on GET is invalid.		1000	✓	✓	✓	
invalid-json-on-get-sleep-max-ms	Maximum sleep in milliseconds between retries when the JSON received on GET is invalid.		10000	✓	✓	✓	
invalid-json-on-get-sleep-multiplicator	Multiplication factor for sleep between retries when the JSON received on GET is invalid.		2	✓	✓	✓	
invalid-json-on-post-max-tries	Maximum number of tries when the JSON received on POST is invalid.		1	✓	✓	✓	
invalid-json-on-post-sleep-initial-ms	Initial sleep in milliseconds between retries when the JSON received on POST is invalid.		1000	✓	✓	✓	
invalid-json-on-post-sleep-max-ms	Maximum sleep in milliseconds between retries when the JSON received on POST is invalid.		10000	✓	✓	✓	
invalid-json-on-post-sleep-multiplicator	Multiplication factor for sleep between retries when the JSON received on POST is invalid.		2	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
invantive-sql-compress-sparse-arrays	Whether to compress sparse arrays in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-correct-invalid-date	Whether to correct dates considered invalid since they are before 01-01-1753. When nullable, they are removed. Otherwise they are replaced by 01-01-1753.	SQL Engine V1	False	✓	✓	✓	
invantive-sql-execution-profile-disk-path	itgen_pae_invantive_sql_execution_profile_disk_path	SQL Engine V1	c:\temp\profiles	✓	✓	✓	
invantive-sql-execution-profile-to-disk	itgen_pae_invantive_sql_execution_profile_to_disk	SQL Engine V1	True	✓	✓	✓	
invantive-sql-forward-filters-to-data-containers	Whether to forward filters to data containers.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-share-byte-arrays	Whether to share the memory used by identical byte arrays in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-share-strings	Whether to share the memory used by identical strings in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-shuffle-fetch-results-data-containers	Whether to shuffle results fetched from data containers.	SQL Engine V1	False	✓	✓	✓	
invantive-use-cache	Whether to cache the results of a query.	SQL Engine V1	True	✓	✓	✓	
join-set-points-per-request	Maximum number of values in a request when executing a join set.	OData	60	✓	✓	✓	
limit-partition-calls-left	Minimum number of remaining API calls on a partition towards a hard limit. When below, an error is raised.	OData	500	✓	✓	✓	
log-native-calls-to-disk-max-events	Maximum number of call events to register from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-max-seconds	Maximum number of seconds to register calls from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-on-error	Registers native calls to data container backend as disk files when the call raised an error.	Shared	False	✓	✓	✓	
log-native-calls-to-disk-on-success	Registers native calls to data container backend as disk files when the call raised no error.	Shared	False	✓	✓	✓	
log-native-calls-to-trace	Log native calls to data container backend on the trace.	Shared	False	✓	✓	✓	
max-odata-filters	Maximum number of OData filter elements.	OData	100	✓	✓	✓	
max-url-length-accepted	The maximum accepted URL length before raising an error.	Shared	8000	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
max-url-length-desired	The maximum desired URL length.	Shared	8000	✓	✓	✓	
maximum-length-identifiers	Non-default maximum length in characters of identifier names.	Shared		✓	✓	✓	
maximum-url-length	Maximum URL Length			✓	✓	✓	
metadata-cache-max-age-sec	Maximum acceptable age in seconds for re-use of metadata.	OData		✓	✓	✓	
oauth-unauthorized-max-tries	Maximum number of tries when an OAuth exception occurs.	OData	2	✓	✓	✓	
oauth-unauthorized-sleep-initial-ms	Initial sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.	OData	10000	✓	✓	✓	
oauth-unauthorized-sleep-max-ms	Maximum sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.	OData	1000	✓	✓	✓	
oauth-unauthorized-sleep-multiplicator	Multiplication factor for sleep between OAuth reauthentication tries when the OAuth authentication fails.	OData	2	✓	✓	✓	
partition-slot-based-rate-limit-length-ms	Total length in milliseconds across all slots of a partition-based rate limit.	Shared	60000	✓		✓	
partition-slot-based-rate-limit-slots	Number of slots per partition-based rate limit. Null means no slot-based rate limit.	Shared		✓		✓	
pre-request-delay-ms	Pre-request delay in milliseconds per request.	Shared	0	✓	✓	✓	
requested-page-size	Preferred number of rows to exchange per round trip; only effective on limited platforms such as AFAS Online.	Shared		✓	✓	✓	
requests-parallel-max	Maximum number of parallel data requests from individual partitions on the data container.	Shared	32	✓	✓	✓	
scopes	Space-separated and case-sensitive list of scope for OAuth only. Leave empty for all available scopes.	Teamleader Focus		✓		✓	✓
simulate-http-400-errors-percentage	Percentage of simulated HTTP 400 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-400-errors	Simulate HTTP 400 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-401-errors-percentage	Percentage of simulated HTTP 401 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-401-errors	Simulate HTTP 401 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
	point.						
simulate-http-403-errors-percentage	Percentage of simulated HTTP 403 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-403-errors	Simulate HTTP 403 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-408-errors-percentage	Percentage of simulated HTTP 408 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-408-errors	Simulate HTTP 408 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-429-errors-percentage	Percentage of simulated HTTP 429 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-429-errors	Simulate HTTP 429 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-500-errors-percentage	Percentage of simulated HTTP 500 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-500-errors	Simulate HTTP 500 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-502-errors-percentage	Percentage of simulated HTTP 502 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-502-errors	Simulate HTTP 502 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-503-errors-percentage	Percentage of simulated HTTP 503 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓

simulate-http-524-errors	itgen_pae_simulate_http_524_errors		False	✓	✓	✓	
simulate-http-protocol-errors-percentage	Percentage of simulated HTTP protocol errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-protocol-errors	Simulate HTTP protocol errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-timeout-errors-percentage	Percentage of simulated HTTP timeout errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-timeout-errors	Simulate HTTP timeout errors when exchanging results with the HTTP endpoint..		False	✓	✓	✓	
slot-based-rate-limit-length-ms	Total length in milliseconds across all slots of a slot-based rate limit.	Shared	60000	✓		✓	
slot-based-rate-limit-slots	Number of slots of a slot-based rate limit. Null means no slot-based rate limit.	Shared		✓		✓	
standardize-identifiers-casing	Rewrite all identifiers to the recommended standard platform-specific casing when changing a data model on a case-dependent platform.	Shared	True	✓	✓	✓	
standardize-identifiers	Rewrite all identifiers to the preferred standards as configured by standardize-identifiers-casing and maximum-length-identifiers.	Shared	True	✓	✓	✓	
use-batch-insert	Whether to use batch insert.	OData	True	✓	✓	✓	
use-http-disk-cache-read	Whether to use HTTP responses from previous queries stored on disk to answer the current query.	Shared	False	✓	✓	✓	
use-http-disk-cache-write	Whether to memorize HTTP responses on disk.	Shared	False	✓	✓	✓	
use-http-memory-cache-read	Whether to use HTTP responses from previous queries stored in memory that can answer the current query.	OData	True	✓	✓	✓	
use-http-memory-cache-write	Whether to memorize HTTP responses from previous queries for use by future queries.	OData	True	✓	✓	✓	

3 Schema: CodeValues

3.1 Tables

3.1.1 Custom_Field_Types: Teamleader Focus Domain Custom_Field_Types

Lookup-table that translates code values of the domain 'Custom_Field_Types' into descriptions.

Catalog: Teamleader

Schema: CodeValues

Label: Domain Custom_Field_Types

Example: The code value 'call' means 'Call'.

Retrieve: true

View Columns

The columns of the view Custom_Field_Types are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
code	string(240)	Code	<input checked="" type="checkbox"/>	Unique code w ithin the domain.
description	string(240)	Description	<input type="checkbox"/>	Meaning of the unique code w ithin the domain.
domain	string(240)	Domain	<input checked="" type="checkbox"/>	Each domain defines a map of codes to values.
resource_code	string(240)	Resource Code	<input type="checkbox"/>	Resource code for internationalization.

Values

Code	Description
call	Call
company	Company
contact	Contact
invoice	Invoice
meeting_report	Meeting report
meeting	Meeting
milestone	Milestone
pro_external_cost	Purchase sheet
product	Product
project_thirdparty	Party in project
project	Project
sale	Deal
subscription	Subscription
ticket	Ticket
todo	Task
werkbonnen	Service sheet

4 Schema: CustomFields

4.1 Tables

4.1.1 Custom_Fields_All: Teamleader Focus All Custom Fields

Catalog: Teamleader

Schema: CustomFields

Label: All Custom Fields

This is a read-only view. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

View Columns

The columns of the view Custom_Fields_All are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
field_group	string	Group	<input type="checkbox"/>	
field_id	int32	ID	<input checked="" type="checkbox"/>	
field_name	string	Name	<input type="checkbox"/>	
field_type	string	Type	<input type="checkbox"/>	
type_code	string(240)	Code	<input checked="" type="checkbox"/>	Unique code w ithin the domain.
type_description	string(240)	Description	<input type="checkbox"/>	Meaning of the unique code w ithin the domain.

5 Schema: Native

5.1 Tables

5.1.1 NATIVEPLATFORMSCALARREQUESTS: Teamleader Focus Native Platform Scalar Requests

```
{res:itgen_native_platform_scalar_requests_desc}
```

Catalog: Teamleader

Schema: Native

Alias: npt

Label: Native Platform Scalar Requests

Documentation:

The NativePlatformScalarRequests table provides direct access to the native API protocol over an established connection to the Teamleader Focus API server. It will contain a new row for every row inserted with a native API request in PAYLOAD_TEXT with the results of unaltered forwarding of the payload to the Teamleader Focus API server.

Retrieve: true

Insert: true

Update: false

Delete: false

View Columns

The columns of the view NATIVEPLATFORMSCALARREQUESTS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
BLOB_PREFERRED	boolean	BLOB Preferred	<input checked="" type="checkbox"/>	Indicator whether a BLOB result is preferred over text.
BOL_RESPONSE_CACHE_MAX_AGE_SEC	int32	Response Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of Bridge Online response cache entries to be used.
CONTENT_TYPE	string(240)	Content Type	<input type="checkbox"/>	
DATE_ENDED	datetime	End Date	<input checked="" type="checkbox"/>	
DATE_STARTED	datetime	Start Date	<input checked="" type="checkbox"/>	
DRY_RUN	boolean	Run without Actions	<input checked="" type="checkbox"/>	
DURATION_MS	int64	Duration (ms)	<input checked="" type="checkbox"/>	
ERROR_MESSAGE_CODE	string(30)	Error Message Code	<input type="checkbox"/>	
ERROR_MESSAGE_TEXT	string(32000)	Error Message Text	<input type="checkbox"/>	
FAIL_ON_ERROR	boolean	Fail on Error	<input checked="" type="checkbox"/>	Whether to raise an exception when processing the native request triggered an error from the provider.
HTTP_DISK_CACHE_MAX_AGE_SEC	int32	HTTP Disk Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of HTTP disk cache entries to be used.
HTTP_DISK_CACHE_SAVE	boolean	Save HTTP Disk Cache	<input type="checkbox"/>	Whether results can be stored in HTTP disk cache.
HTTP_DISK_CACHE_USE	boolean	Use HTTP Disk Cache	<input type="checkbox"/>	Whether results can be fetched from HTTP disk cache.
HTTP_MEMORY_CACHE_MAX_AGE_SEC	int32	HTTP Memory Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of HTTP memory cache entries to be used.
HTTP_MEMORY_CACHE_SAVE	boolean	Save HTTP Memory Cache	<input type="checkbox"/>	Whether results can be stored in HTTP memory cache.
HTTP_MEMORY_CACHE_USE	boolean	Use HTTP Memory Cache	<input type="checkbox"/>	Whether results can be fetched from HTTP memory cache.
HTTP_METHOD	string(30)	HTTP Method	<input type="checkbox"/>	
HTTP_STATUS_CODE	int32	HTTP Status Code	<input type="checkbox"/>	
ORIG_SYSTEM_GROUP	string(4000)	Original System Group	<input type="checkbox"/>	
ORIG_SYSTEM_REFERENCE	string(4000)	Original System Reference	<input type="checkbox"/>	
PAYLOAD_TEXT	string	Payload	<input type="checkbox"/>	
RESULT_BLOB	byte[]	Result BLOB	<input type="checkbox"/>	
RESULT_DATE_TIME_UTC	datetime	Result Date Time	<input type="checkbox"/>	
RESULT_NUMBER	decimal	Result Number	<input type="checkbox"/>	
RESULT_TEXT	string	Result Text	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
SUCCESSFUL	boolean	Successful	<input checked="" type="checkbox"/>	
TIMEOUT_SEC	int32	Timeout (sec)	<input type="checkbox"/>	Timeout in seconds.
TRANSACTION_ID	int64	Transaction ID	<input checked="" type="checkbox"/>	Incrementing ID of the transaction.
URL	string(4000)	URL	<input type="checkbox"/>	

6 Schema: V1

6.1 Tables

6.1.1 all_deal_phase_changes: Teamleader Focus All Deal Phase Changes

Catalog: Teamleader

Schema: V1

Primary Keys: deal_id

Label: All Deal Phase Changes

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function all_deal_phase_changes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
date_from	datetime	<input checked="" type="checkbox"/>		
date_to	datetime	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function all_deal_phase_changes are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
change_date_formatted	string(20)	Change Date (Formatted)	<input type="checkbox"/>	
change_date	datetime	Change Date	<input type="checkbox"/>	
deal_id	int32	Deal ID	<input type="checkbox"/>	
new_phase_id	int32	New Phase ID	<input type="checkbox"/>	
old_phase_id	int32	Old Phase ID	<input type="checkbox"/>	
related_user_id	int32	Related User ID	<input type="checkbox"/>	

6.1.2 bookkeeping_accounts: Teamleader Focus Bookkeeping Accounts

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Bookkeeping Accounts

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function bookkeeping_accounts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
sys_department_id	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function bookkeeping_accounts are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account	string	Account	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
id	int32	ID	<input checked="" type="checkbox"/>	
name_fr	string	Name (French)	<input type="checkbox"/>	
name_nl	string	Name (Dutch)	<input type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	

6.1.3 business_types: Teamleader Focus Business Types

Catalog: Teamleader

Schema: V1

Label: Business Types

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `business_types`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
country	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `business_types` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
name	string	Name	<input type="checkbox"/>	

6.1.4 call_custom_field_values_by_id: Teamleader Focus Call Custom Field Values by ID

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Call Custom Field Values by ID

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function call_custom_field_values_by_id. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
call_id	int32	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function call_custom_field_values_by_id are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
id	int32	ID	<input checked="" type="checkbox"/>	
key	int32	Key	<input checked="" type="checkbox"/>	
position	int32	Position	<input type="checkbox"/>	
value	string	Value	<input type="checkbox"/>	

6.1.5 call: Teamleader Focus Call

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Call

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function call. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

telephone	string	Telephone	<input type="checkbox"/>	
user_id	int32	User ID	<input type="checkbox"/>	
user_name	string	User Name	<input type="checkbox"/>	

6.1.7 companies: Teamleader Focus Companies

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Companies

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function companies. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
filter_by_tag	string	<input type="checkbox"/>		Select only contacts with this tag.
modifiedsince	datetime	<input type="checkbox"/>		Select contacts modified and/or added since this timestamp.
searchby	string	<input type="checkbox"/>		A search string. Teamleader Focus will try to match each part of the string to the forename, surname, company name and email address.
segment_id	decimal	<input type="checkbox"/>		Select contacts with this segment ID.
selected_customfields	string	<input type="checkbox"/>		Comma-separated list of the IDs of the custom fields you wish to select with a maximum of 10.

6.1.15 contacts_by_company: Teamleader Focus Contacts by Company

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Contacts by Company

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `contacts_by_company`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
company_id	decimal	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `contacts_by_company` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
decision_maker	boolean	Decision Maker	<input checked="" type="checkbox"/>	
email	string	Email	<input type="checkbox"/>	
function	string	Function	<input type="checkbox"/>	
gsm	string	Mobile Phone	<input type="checkbox"/>	
id	int32	ID	<input checked="" type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	
telephone	string	Telephone	<input type="checkbox"/>	

6.1.16 contacts: Teamleader Focus Contacts

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Contacts

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `contacts`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
filter_by_tag	string	<input type="checkbox"/>		Select only contacts with this tag.
modifiedsince	datetime	<input type="checkbox"/>		Select contacts modified and/or added since this timestamp.
searchby	string	<input type="checkbox"/>		A search string. Teamleader Focus will try to match each part of the string to the forename, surname, company name and email address.
segment_id	decimal	<input type="checkbox"/>		Select contacts with this segment ID.
selected_customfields	string	<input type="checkbox"/>		Comma-separated list of the IDs of the custom fields you wish to select with a maximum of 10.

Columns of Table Function

The columns of the table function contacts are shown below. Each column has an SQL data type.

6.1.26 custom_fields: Teamleader Focus Custom Fields

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Custom Fields

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `custom_fields`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
for	string	<input checked="" type="checkbox"/>		Selects custom fields of a specific type: 'contact', 'company', 'sale', 'project', 'invoice', 'ticket', 'milestone', 'todo' or 'meeting'.

Columns of Table Function

The columns of the table function `custom_fields` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
for	string	Concerns	<input type="checkbox"/>	
group	string	Group	<input type="checkbox"/>	
id	int32	ID	<input checked="" type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	
type	string	Type	<input type="checkbox"/>	

6.1.27 `days_off_by_user`: Teamleader Focus Days Off by User

Catalog: Teamleader

Schema: V1

Label: Days Off by User

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `days_off_by_user`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Columns of Table Function

The columns of the table function `file_information` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
<code>date_last_edited_formatted</code>	<code>string(20)</code>	Last Edited (Formatted)	<input type="checkbox"/>	
<code>date_last_edited</code>	<code>datetime</code>	Last Edited	<input type="checkbox"/>	
<code>filename</code>	<code>string</code>	File Name	<input type="checkbox"/>	
<code>filesize_bytes</code>	<code>int32</code>	File Size (bytes)	<input type="checkbox"/>	
<code>folder</code>	<code>string</code>	Folder	<input type="checkbox"/>	
<code>related_object_id</code>	<code>int32</code>	Related Object ID	<input type="checkbox"/>	
<code>related_object_type</code>	<code>string</code>	Related Object Type	<input type="checkbox"/>	
<code>uploader_client_id</code>	<code>int32</code>	Uploader Client ID	<input type="checkbox"/>	

6.1.41 files: Teamleader Focus Files

Catalog: Teamleader

Schema: V1

Primary Keys: `id`

Label: Files

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `files`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
<code>folder_name</code>	<code>string</code>	<input type="checkbox"/>		Selects only files in the indicated folder.
<code>object_id</code>	<code>int32</code>	<input checked="" type="checkbox"/>		ID of the object of indicated type.

Name	Data Type	Required	Default Value	Documentation
object_type	string	<input checked="" type="checkbox"/>		Selects only notes for a specific type. Default is null. Other possible values are: 'contact', 'company' or 'sale'.

Columns of Table Function

The columns of the table function files are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
date_last_edited	datetime	Last Edited	<input type="checkbox"/>	
filename	string	File Name	<input type="checkbox"/>	
filesize_bytes	int32	File Size (bytes)	<input type="checkbox"/>	
id	int32	ID	<input checked="" type="checkbox"/>	

6.1.42 invoice_by_number_items: Teamleader Focus Invoice Items by Invoice Number

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Invoice Items by Invoice Number

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function invoice_by_number_items. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

6.1.51 invoices_by_deal: Teamleader Focus Invoices by Deal

Catalog: Teamleader

Schema: V1

Label: Invoices by Deal

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `invoices_by_deal`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
deal_id	decimal	<input checked="" type="checkbox"/>

Schema: V1

Label: Notes

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function notes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
object_id	int32	<input checked="" type="checkbox"/>		ID of the object of indicated type.
object_type	string	<input checked="" type="checkbox"/>		Selects only notes for a specific type. Default is null. Other possible values are: 'contact', 'company' or 'sale'.

Columns of Table Function

The columns of the table function notes are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
date	datetime	Date	<input type="checkbox"/>	
long_description	string	Long Description	<input type="checkbox"/>	
short_description	string	Short Description	<input type="checkbox"/>	
type	string	Type	<input type="checkbox"/>

6.1.77 projects: Teamleader Focus Projects

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Projects

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `projects`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
<code>searchby</code>	string	<input type="checkbox"/>		A search string.
<code>selected_customfields</code>	string	<input type="checkbox"/>		Comma-separated list of the IDs of the custom fields you wish to select with a maximum of 10.

Name	Data Type	Required	Default Value	Documentation
show_active_only	int32	<input type="checkbox"/>	0	The default 0 selects all projects; when 1 only active projects will be selected.

Columns of Table Function

The columns of the table function projects are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
id	int32	ID	<input checked="" type="checkbox"/>	
phase	string	Phase	<input type="checkbox"/>	
start_date_formatted	string(20)	Start Date (Formatted)	<input type="checkbox"/>	
start_date	datetime	Start Date	<input type="checkbox"/>	
title	string	Title	<input checked="" type="checkbox"/>	

6.1.78 related_parties_by_project: Teamleader Focus Related Parties by Project

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Related Parties by Project

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function related_parties_by_project. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
project_id	decimal	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function related `_parties_by_project` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
email	string	Email	<input type="checkbox"/>	
group	string	Group	<input type="checkbox"/>	
id	int32	ID	<input checked="" type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	
role	string	Role	<input type="checkbox"/>	
telephone	string	Telephone	<input type="checkbox"/>	
type	string	Type	<input type="checkbox"/>	

6.1.79 related_subscriptions_by_invoice: Teamleader Focus Related Subscriptions by Invoice

Catalog: Teamleader

Schema: V1

Primary Keys: `subscription_id`

Label: Related Subscriptions by Invoice

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `related_subscriptions_by_invoice`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

The following parameters can be used to control the behaviour of the table function task. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

6.1.92 tasks_by_milestone: Teamleader Focus Tasks by Milestone

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Tasks by Milestone

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariant UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `tasks_by_milestone`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four para-

meters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
milestone_id	int32	<input checked="" type="checkbox"/>		ID of the milestone to select.

Columns of Table Function

The columns of the table function `tasks_by_milestone` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
description	string	Description	<input type="checkbox"/>	
done	boolean	Done	<input checked="" type="checkbox"/>	
due_date	datetime	Due Date	<input type="checkbox"/>	
estimated_total_time_minutes	decimal	Estimated Total Time (Minutes)	<input type="checkbox"/>	
id	int32	ID	<input checked="" type="checkbox"/>	
owner_name	string	Owner Name	<input type="checkbox"/>	
priority	string	Priority	<input type="checkbox"/>	
task_type	string	Task Type	<input type="checkbox"/>	
time_remaining_minutes	decimal	Time Remaining (Minutes)	<input type="checkbox"/>	
time_tracked_minutes	decimal	Time Tracked (Minutes)	<input type="checkbox"/>	

6.1.93 tasks: Teamleader Focus Tasks

Catalog: Teamleader

Schema: V1

Primary Keys: id

Label: Tasks

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `tasks`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Val-

ues can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `timetracking_entry`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
<code>timetracking_id</code>	int32	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `timetracking_entry` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
<code>company_id</code>	int32	Company ID	<input type="checkbox"/>	
<code>contact_id</code>	int32	Contact ID	<input type="checkbox"/>	
<code>date_formatted</code>	string(20)	Date (Formatted)	<input type="checkbox"/>	
<code>date</code>	datetime	Date	<input type="checkbox"/>	
<code>description</code>	string	Description	<input type="checkbox"/>	
<code>duration</code>	decimal	Duration	<input type="checkbox"/>	
<code>employee_name</code>	string	Employee Name	<input type="checkbox"/>	
<code>id</code>	int32	ID	<input checked="" type="checkbox"/>	
<code>is_invoiceable</code>	boolean	Is Invoiceable?	<input checked="" type="checkbox"/>	
<code>milestone_id</code>	int32	Milestone ID	<input type="checkbox"/>	
<code>milestone_title</code>	string	Milestone Title	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
project_id	int32	Project ID	<input type="checkbox"/>	
project_title	string	Project Title	<input type="checkbox"/>

9.1.2 BusinessTypes: Teamleader Focus Business Types

Catalog: Teamleader

Schema: V2

Primary Keys: id

Label: Business Types

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BusinessTypes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
country	string	<input type="checkbox"/>		

Columns of Table Function

The columns of the table function BusinessTypes are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
country	string	Country	<input checked="" type="checkbox"/>	
id	string	ID	<input checked="" type="checkbox"/>	
name	string	Name	<input checked="" type="checkbox"/>

9.1.10 CompanyEmailAddresses: Teamleader Focus Company Email Addresses

Catalog: Teamleader

Schema: V2

Primary Keys: id

Label: Company Email Addresses

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CompanyEmailAddresses. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
company_id	guid	<input type="checkbox"/>		
term	string	<input type="checkbox"/>		Filters on first_name, last_name, email and telephone.
updated_since	datetime	<input type="checkbox"/>		
vat_number	string	<input type="checkbox"/>		

Columns of Table Function

The columns of the table function CompanyEmailAddresses are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
company_id	string	Company ID	<input checked="" type="checkbox"/>	
company_name	string	Company Name	<input checked="" type="checkbox"/>	
company_updated_at	datetime		<input checked="" type="checkbox"/>	
email	string	Email	<input checked="" type="checkbox"/>	
type	string	Type	<input checked="" type="checkbox"/>

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomFieldsBySubscriptionId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	string	<input checked="" type="checkbox"/>

9.1.62 MeetingByld

Catalog: Teamleader

Schema: V2

Primary Keys: id

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function MeetingByld. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

9.1.76 Products: Teamleader Focus Products

Catalog: Teamleader

Schema: V2

Primary Keys: id

Label: Products

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Products. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
term	string	<input type="checkbox"/>		Search for term in name and code.
updated_since	datetime	<input type="checkbox"/>		

Columns of Table Function

The columns of the table function Products are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
added_at	datetime	Added At	<input type="checkbox"/>	
code	string		<input type="checkbox"/>	
configuration_stock_threshold_action	string		<input type="checkbox"/>	
configuration_stock_threshold_minimum	decimal		<input type="checkbox"/>	
description	string	Description	<input type="checkbox"/>	
id	string	ID	<input checked="" type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	
stock_amount	decimal		<input type="checkbox"/>	
unit_id	string	Unit ID	<input type="checkbox"/>	
unit_type	string	Unit Type	<input type="checkbox"/>	
updated_at	datetime	Updated At	<input type="checkbox"/>	

9.1.77 ProjectAssigneesV2: Teamleader Focus Projects

Catalog: Teamleader

Schema: V2

Primary Keys: id

Label: Projects

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectAssigneesV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a predefined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
status	string	<input type="checkbox"/>		Either 'open', 'planned', 'running', 'over_budget', 'closed' or 'over-due'.
term	string	<input type="checkbox"/>		Filters on the project number, title, customer names, assignee names and owner names. Terms are split on spaces and all terms need to match.

Columns of Table Function

The columns of the table function ProjectAssigneesV2 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
id	string	ID	<input type="checkbox"/>	
project_id	string	Project ID	<input checked="" type="checkbox"/>	
project_key	int32		<input type="checkbox"/>	Positive, sequential integer representing the index of the project for the account
project_title	string	Project Title	<input checked="" type="checkbox"/>	
type	string	Type	<input type="checkbox"/>	

9.1.78 ProjectById: Teamleader Focus Project by ID

Catalog: Teamleader

Label: Project Participants by Project ID

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invariantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectParticipantsByProjectId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

9.1.97 SubscriptionLinesBySubscriptionId: Teamleader Focus Subscription Lines by Subscription ID

Catalog: Teamleader

Schema: V2

Primary Keys: id

Label: Subscription Lines by Subscription ID

This is a read-only table function. The Teamleader Focus API may not support changing the data or the Invantive UniversalSQL driver for Teamleader Focus does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Teamleader Focus API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SubscriptionLinesBySubscriptionId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.
