## Important Safety and Usage Information

**Intended Use and Limitations:** This software, developed by Invantive, is designed to support a variety of business and information technology data processing functions, such as accounting, financial reporting and sales reporting. It is important to note that this software is not designed, tested, or approved for use in environments where malfunction or failure could lead to life-threatening situations or severe physical or environmental damage. This includes, but is not limited to:

- Nuclear facilities: The software should not be used for operations or functions related to the control, maintenance, or operation of nuclear facilities.
- Defense and Military Applications: This software is not suitable for use in defense-related applications, including but not limited to weaponry control, military strategy planning, or any other aspects of national defense.
- Aviation: The software is not intended for use in the operation, navigation, or communication systems of any aircraft or air traffic control environments.
- Healthcare and Medicine Production: This software should not be utilized for medical device operation, patient data analysis for critical health decisions, pharmaceutical production, or medical research where its failure or malfunction could impact patient health.
- Chemical and Hazardous Material Handling: This software is not intended for the management, control, or operational aspects of chemical plants or hazardous material handling facilities. Any malfunction in software used in these settings could result in dangerous chemical spills, explosions, or environmental disasters.
- Transportation and Traffic Control Systems: The software should not be used for the control, operation, or management of transportation systems, including railway signal controls, subway systems, or traffic light management. Malfunctions in such critical systems could lead to severe accidents and endanger public safety.
- Energy Grid and Utility Control Systems: This software is not designed for the control or operation of energy grid systems, including electrical substations, renewable energy control systems, or water utility control systems. The failure of software in these areas could lead to significant power outages, water supply disruptions, or other public utility failures, potentially endangering communities and causing extensive damage.
- Other High-Risk Environments: Any other critical infrastructure and environments where a failure of the software could result in significant harm to individuals or the environment.

**User Responsibility:** Users must ensure that they understand the intended use of the software and refrain from deploying it in any setting that falls outside of its designed purpose. It is the responsibility of the user to assess the suitability of the software for their intended application, especially in any scenarios that might pose a risk to life, health, or the environment.

**Disclaimer of Liability:** Invantive disclaims any responsibility for damage, injury, or legal consequences resulting from the use or misuse of this software in prohibited or unintended applications.

## 1 SQL Driver for Tixly API

Invantive SQL is the fastest, easiest and most reliable way to exchange data with the Tixly API.

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the [user community](#). Invantive Support or other users will try to help you.

Tixly is online software for leisure and entertainment management. Tixly is available globally.

The Tixly driver covers 79 tables and 1847 columns.

### Tixly API Clients

Invantive SQL is available on many user interfaces ("clients" in traditional server-client paradigm). All Invantive SQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

The [Tixly Power BI connector](#) is based on the Invantive SQL driver for Tixly, completed by a high-performance OData connector which works straight on Power BI without any add-on. The OData protocol is always version 4, independent whether the backing platform uses OData, SOAP or another protocol.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL. High-volume replication of data taken from the Tixly API into traditional databases such as SQL Server (on-premises and Azure), MySQL, PostgreSQL and Oracle is possible using [Invantive Data Replicator](#). Invantive Data Replicator automatically creates and maintains Tixly datawarehouses, possibly in combination with data from over 75 other (cloud) platforms. Invantive Data Replicator supports data volumes up to over 1 TB and over 5.000 companies. The on-premise edition of Invantive Bridge offers an Tixly ADO.net provider.

Finally, online web apps can be build for Tixly using App Online of [Invantive Cloud](#).

### Monitor API Calls

When a query or DML-statement has been executed on Invantive SQL a developer can evaluate the actual calls made to the Tixly API using a query on sessionios@DataDictionary. As an alternative, extensive request and response logging can be enabled by setting log-native-calls-to-disk to true. In the %USERPROFILE%\Invantive\NativeLog folder Invantive SQL will create log files per Tixly API request and response.

### Specifications

The SQL driver for Tixly does not support partitioning. Define one data container in a database for each company in Tixly to enable parallel access for data from multiple companies.

An introduction into the concepts of Invantive SQL such as databases, data containers and partitioning can be found in the [Invantive SQL grammar](#).

The configuration can be changed using various attributes from the database definition, on log on and during use. A full list of configuration options is listed in the [driver attributes](#) <sup>2</sup>.

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On Tixly the comparison of two texts is case sensitive by default.

Changes and bug fixes on the Tixly SQL driver can be found in the [release notes](#). Get access to the community through the [Tixly section](#) of the Invantive forums.

Driver code for use in settings.xml: `Tixly`

Alias: `tixly`

Recommended alias: `tly`

Driver code for use in settings.xml

Updated 22-12-2022 21:15 using Invantive SQL version 22.1.101-BETA+3681.

## 2 SQL Driver Attributes for Tixly API

The SQL driver for Tixly has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of Tixly or high volumes of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The Tixly driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings\*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for Tixly can be found in the settings\*.xml file used for the database. The reference manuals contain instructions how to relocate the settings\*.xml files. Settings\*.xml files are typically located in the %USERPROFILE%\invantive folder in most deployment scenarios. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The Tixly driver can be configured using the following attributes:

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
add-odata-mandatory-filters	Whether to automatically add OData filters deemed necessary by the platform.	OData	False	✓	✓	✓	
analysis-enforce-row-uniqueness	Enforce rows to be unique for software analysis.	Shared	False	✓	✓	✓	
api-access-token	Access Token is a security token for multiple OAuth2 Flows. With an Access Token you can access protected resources. An Access Token must be stored securely since once compromised allows access to your protected resources.	OData		✓		✓	✓
api-client-id	The client ID is a unique identifier of your application. It is generated by registering an application.	OData		✓		✓	✓
api-client-secret	The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.	OData		✓		✓	✓
api-pre-expiry-refresh-sec	The number of seconds before the token expires to acquire a new token.	OData		✓	✓	✓	
api-redirect-url	The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.	OData		✓		✓	✓
api-refresh-token	Refresh Token is a security token for the OAuth2 Code Grant Flow. With a Refresh Token and client secret you can retrieve a renewed access token to access protected resources. A Refresh Token and client secret must be stored securely since once compromised allows access to your protected resources.	OData		✓		✓	✓
api-scope	The authorization scope(s) to request an OAuth token for.	OData		✓		✓	
api-token-url	The token URI is the OAuth2 endpoint to exchange tokens with.	OData		✓		✓	
api-url	URL of web service.	OData		✓		✓	
bulk-delete-page-size-rows	Number of rows to delete per batch when bulk deleting.	Shared	10000	✓	✓	✓	
bulk-insert-page-size-bytes	Approximate maximum size in bytes of batch when bulk inserting.	Shared	10000000	✓	✓	✓	
bulk-insert-page-size-rows	Number of rows to insert per batch when bulk inserting.	Shared	250	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On

download-error-other-exception-sleep-initial-ms	Initial sleep in milliseconds between retries when an unqualified error occurs during retrieval of data.		10000	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
download-error-other-exception-sleep-max-ms	Maximum sleep in milliseconds between retries when an unqualified error occurs during retrieval of data.		300000	✓	✓	✓	
download-error-other-exception-sleep-multiplicator	Multiplication factor for sleep between retries when an unqualified error occurs during retrieval of data.		2	✓	✓	✓	
download-error-socket-exception-max-tries	Maximum number of tries when the network connection is forcibly dropped during retrieval of data.		10	✓	✓	✓	
download-error-socket-exception-sleep-initial-ms	Initial sleep in milliseconds between retries when the network connection is forcibly dropped during retrieval of data.		10000	✓	✓	✓	
download-error-socket-exception-sleep-max-ms	Maximum sleep in milliseconds between retries when the network connection is forcibly dropped during retrieval of data.		300000	✓	✓	✓	
download-error-socket-exception-sleep-multiplicator	Multiplication factor for sleep between retries when the network connection is forcibly dropped during retrieval of data.		2	✓	✓	✓	
download-error-web-exception-max-tries	Maximum number of tries when a web connection failure occurs during retrieval of data.		10	✓	✓	✓	
download-error-web-exception-sleep-initial-ms	Initial sleep in milliseconds between retries when a web connection failure occurs during retrieval of data.		10000	✓	✓	✓	
download-error-web-exception-sleep-max-ms	Maximum sleep in milliseconds between retries when a web connection failure occurs during retrieval of data.		300000	✓	✓	✓	
download-error-web-exception-sleep-multiplicator	Multiplication factor for sleep between retries when a web connection failure occurs during retrieval of data.		2	✓	✓	✓	
download-error-web-not-implemented-max-tries	Maximum number of tries when the connection reports not implemented.		1	✓	✓	✓	
download-error-web-not-implemented-sleep-initial-ms	Initial sleep in milliseconds between retries when the connection reports not implemented.		10000	✓	✓	✓	
download-error-web-not-implemented-sleep-max-ms	Maximum sleep in milliseconds between retries when the connection reports not implemented.		300000	✓	✓	✓	
download-error-web-not-	Multiplication factor for sleep between retries when the connection reports not implemented.		2	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
implemented-sleep-multiplicator							
download-error-web-timeout-max-tries	Maximum number of tries when the connection reports a timeout.		10	✓	✓	✓	
download-error-web-timeout-sleep-initial-ms	Initial sleep in milliseconds between retries when the connection reports a timeout.		1000	✓	✓	✓	
download-error-web-timeout-sleep-max-ms	Maximum sleep in milliseconds between retries when the connection reports a timeout.		30000	✓	✓	✓	
download-error-web-timeout-sleep-multiplicator	Multiplication factor for sleep between retries when the connection reports a timeout.		2	✓	✓	✓	
download-error-web-unauthorized-max-tries	Maximum number of tries when the connection reports an unauthorized error.		1	✓	✓	✓	
download-error-web-unauthorized-sleep-initial-ms	Initial sleep in milliseconds between retries when the connection reports an unauthorized error.		10000	✓	✓	✓	
download-error-web-unauthorized-sleep-max-ms	Maximum sleep in milliseconds between retries when the connection reports an unauthorized error.		300000	✓	✓	✓	
download-error-web-unauthorized-sleep-multiplicator	Multiplication factor for sleep between retries when the connection reports an unauthorized error.		2	✓	✓	✓	
fail-on-duplicate-rows	When true, an error is raised when there are multiple rows with identical values in a single table..		False	✓	✓	✓	✓
force-case-sensitive-identifiers	Consider identifiers as case-sensitive independent of the platform capabilities.	Shared	False	✓	✓	✓	
forced-casing-identifiers	Forced casing of identifiers. Choose from: Unset, Lower, Upper and Mixed.	Shared		✓	✓	✓	
http-disk-cache-compression-level	Compression level for the HTTP disk cache, ranging from 1 (little) to 9 (intense). Default is 5.	Shared	5	✓	✓	✓	
http-disk-cache-directory	Directory where HTTP cache is stored.	Shared	C:\Users\gle3.WS212\Invasive\Cache\http\gle3\shared	✓	✓	✓	
http-disk-cache-ignore-write-errors	Whether to ignore write errors to disk cache.	Shared	False	✓	✓	✓	
http-disk-cache-max-age-sec	Maximum acceptable age in seconds for use of data in the HTTP disk cache.	Shared	2592000	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
http-get-timeout-max-ms	HTTP GET maximum timeout on retry (ms).		24000	✓	✓	✓	
http-get-timeout-ms	HTTP GET timeout (ms).		56000	✓	✓	✓	
http-memory-cache-compression-level	Compression level for the HTTP memory cache, ranging from 1 (little) to 9 (intense). Default is 5.	OData	5	✓	✓	✓	
http-memory-cache-max-age-sec	Maximum acceptable age in seconds for use of data in the HTTP memory cache.	OData	14400	✓	✓	✓	
http-post-timeout-max-ms	HTTP POST maximum timeout on retry (ms).		58000	✓	✓	✓	
http-post-timeout-ms	HTTP POST timeout (ms).		57000	✓	✓	✓	
ignore-http-400-errors	Ignore HTTP 400 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-401-errors	Ignore HTTP 401 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-402-errors	Ignore HTTP 402 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-403-errors	Ignore HTTP 403 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-404-errors	Ignore HTTP 404 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-422-errors	Ignore HTTP 422 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-429-errors	Ignore HTTP 429 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-500-errors	Ignore HTTP 500 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-502-errors	Ignore HTTP 502 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-http-503-errors	Ignore HTTP 503 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
ignore-unknown-path-type	Whether to ignore path types not yet supported. An error will be generated when an unsupported type occurs.		True	✓	✓	✓	✓
ignore-values-unknown-path	Whether to ignore values outside of processed paths. An error will be		True	✓	✓	✓	✓

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
	generated when a value occurs outside a path otherwise.						
invalid-json-on-get-max-tries	Maximum number of tries when the JSON received on GET is invalid.		1	✓	✓	✓	
invalid-json-on-get-sleep-initial-ms	Initial sleep in milliseconds between retries when the JSON received on GET is invalid.		1000	✓	✓	✓	
invalid-json-on-get-sleep-max-ms	Maximum sleep in milliseconds between retries when the JSON received on GET is invalid.		10000	✓	✓	✓	
invalid-json-on-get-sleep-multiplicator	Multiplication factor for sleep between retries when the JSON received on GET is invalid.		2	✓	✓	✓	
invalid-json-on-post-max-tries	Maximum number of tries when the JSON received on POST is invalid.		1	✓	✓	✓	
invalid-json-on-post-sleep-initial-ms	Initial sleep in milliseconds between retries when the JSON received on POST is invalid.		1000	✓	✓	✓	
invalid-json-on-post-sleep-max-ms	Maximum sleep in milliseconds between retries when the JSON received on POST is invalid.		10000	✓	✓	✓	
invalid-json-on-post-sleep-multiplicator	Multiplication factor for sleep between retries when the JSON received on POST is invalid.		2	✓	✓	✓	
invantive-sql-compress-sparse-arrays	Whether to compress sparse arrays in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-correct-invalid-date	Whether to correct dates considered invalid since they are before 01-01-1753. When nullable, they are removed. Otherwise they are replaced by 01-01-1753.	SQL Engine V1	False	✓	✓	✓	
invantive-sql-forward-filters-to-data-containers	Whether to forward filters to data containers.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-share-byte-arrays	Whether to share the memory used by identical byte arrays in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-share-strings	Whether to share the memory used by identical strings in result sets during compression.	SQL Engine V1	True	✓	✓	✓	
invantive-sql-shuffle-fetch-results-data-containers	Whether to shuffle results fetched from data containers.	SQL Engine V1	False	✓	✓	✓	
invantive-use-cache	Whether to cache the results of a query.	SQL Engine V1	True	✓	✓	✓	
join-set-points-per-request	Maximum number of values in a request when executing a join set.	OData	60	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
limit-partition-calls-left	Minimum number of remaining API calls on a partition towards a hard limit. When below, an error is raised.	OData	500	✓	✓	✓	
log-native-calls-to-disk-max-events	Maximum number of call events to register from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-max-seconds	Maximum number of seconds to register calls from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-on-error	Registers native calls to data container backend as disk files when the call raised an error.	Shared	False	✓	✓	✓	
log-native-calls-to-disk-on-success	Registers native calls to data container backend as disk files when the call raised no error.	Shared	False	✓	✓	✓	
log-native-calls-to-trace	Log native calls to data container backend on the trace.	Shared	False	✓	✓	✓	
maximum-discovered-column-count	Maximum number of discovered columns. An error will be generated when the column exceeds this value.		250	✓	✓	✓	✓
maximum-length-identifiers	Non-default maximum length in characters of identifier names.	Shared		✓	✓	✓	
max-odata-filters	Maximum number of OData filter elements.	OData	100	✓	✓	✓	
max-url-length-accepted	The maximum accepted URL length before raising an error.	Shared	8000	✓	✓	✓	
max-url-length-desired	The maximum desired URL length.	Shared	8000	✓	✓	✓	
metadata-cache-max-age-sec	Maximum acceptable age in seconds for re-use of metadata.	OData		✓	✓	✓	
oauth-unauthorized-max-tries	Maximum number of tries when an OAuth exception occurs.	OData	2	✓	✓	✓	
oauth-unauthorized-sleep-initial-ms	Initial sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.	OData	10000	✓	✓	✓	
oauth-unauthorized-sleep-max-ms	Maximum sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.	OData	1000	✓	✓	✓	
oauth-unauthorized-sleep-multiplicator	Multiplication factor for sleep between OAuth reauthentication tries when the OAuth authentication fails.	OData	2	✓	✓	✓	
partition-slot-based-rate-limit-length-ms	Total length in milliseconds across all slots of a partition-based rate limit.	Shared	60000	✓		✓	
partition-slot-based-rate-limit-slots	Number of slots per partition-based rate limit. Null means no slot-based rate limit.	Shared		✓		✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
pre-request-delay-ms	Pre-request delay in milliseconds per request.	Shared	0	✓	✓	✓	
requested-page-size	Preferred number of rows to exchange per round trip; only effective on limited platforms such as AFAS Online.	Shared		✓	✓	✓	
requests-parallel-max	Maximum number of parallel data requests from individual partitions on the data container.	Shared	32	✓	✓	✓	
simulate-http-400-errors	Simulate HTTP 400 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-400-errors-percentage	Percentage of simulated HTTP 400 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-401-errors	Simulate HTTP 401 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-401-errors-percentage	Percentage of simulated HTTP 401 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-403-errors	Simulate HTTP 403 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-403-errors-percentage	Percentage of simulated HTTP 403 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-408-errors	Simulate HTTP 408 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-408-errors-percentage	Percentage of simulated HTTP 408 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-429-errors	Simulate HTTP 429 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-429-errors-percentage	Percentage of simulated HTTP 429 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-500-errors	Simulate HTTP 500 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-500-errors-percentage	Percentage of simulated HTTP 500 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-502-errors	Simulate HTTP 502 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-502-errors-percentage	Percentage of simulated HTTP 502 errors when exchanging results		0	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Driver's File	Set from Log On
	w ith the HTTP endpoint.						
simulate-http-503-errors	Simulate HTTP 503 errors w hen exchanging results w ith the HTTP endpoint.		False	✓	✓	✓	
simulate-http-503-errors-percentage	Percentage of simulated HTTP 503 errors w hen exchanging results w ith the HTTP endpoint.		0	✓	✓	✓	
simulate-http-protocol-errors	Simulate HTTP protocol errors w hen exchanging results w ith the HTTP endpoint.		False	✓	✓	✓	
simulate-http-protocol-errors-percentage	Percentage of simulated HTTP protocol errors w hen exchanging results w ith the HTTP endpoint.		0	✓	✓	✓	
simulate-http-timeout-errors	Simulate HTTP timeout errors w hen exchanging results w ith the HTTP endpoint..		False	✓	✓	✓	
simulate-http-timeout-errors-percentage	Percentage of simulated HTTP timeout errors w hen exchanging results w ith the HTTP endpoint.		0	✓	✓	✓	
slot-based-rate-limit-length-ms	Total length in milliseconds across all slots of a slot-based rate limit.	Shared	60000	✓		✓	
slot-based-rate-limit-slots	Number of slots of a slot-based rate limit. Null means no slot-based rate limit.	Shared		✓		✓	
standardize-identifiers	Rew rite all identifiers to the preferred standards as configured by standardize-identifiers-casing and maximum-length-identifiers.	Shared	True	✓	✓	✓	
standardize-identifiers-casing	Rew rite all identifiers to the recommended standard platform-specific casing w hen changing a data model on a case-dependent platform.	Shared	True	✓	✓	✓	
swagger-specification-file	The Swagger file path, such as C:\temp\swagger.json.			✓	✓	✓	✓
swagger-specification-http-disk-cache-max-age-sec	Maximum acceptable age in seconds for use of Swagger specification data in the HTTP disk cache.		86400	✓	✓	✓	
swagger-specification-url	The Swagger URL such as https://example.org/rest/swagger.json.			✓	✓	✓	✓
use-batch-insert	Whether to use batch insert.	OData	True	✓	✓	✓	
use-http-disk-cache-read	Whether to use HTTP responses from previous queries stored on disk to answer the current query.	Shared	False	✓	✓	✓	
use-http-disk-cache-write	Whether to memorize HTTP responses on disk.	Shared	False	✓	✓	✓	

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
use-http-memory-cache-read	Whether to use HTTP responses from previous queries stored in memory that can answer the current query.	OData	True	✓	✓	✓	
use-http-memory-cache-write	Whether to memorize HTTP responses from previous queries for use by future queries.	OData	True	✓	✓	✓	

## 3 Schema: Customer

### 3.1 Tables

#### 3.1.1 AnonymizedCustomers: Tixly Anonymized Customers

Gets merged customers details.

Catalog: Tixly

Schema: Customer

Label: Anonymized Customers

This is a read-only table function. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

### Parameters of Table Function

The following parameters can be used to control the behaviour of the table function AnonymizedCustomers. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
DateFrom	datetime	<input type="checkbox"/>		
DateTo	datetime	<input type="checkbox"/>		

### Columns of Table Function

The columns of the table function AnonymizedCustomers are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Anonymized	datetime	Anonymized	<input type="checkbox"/>	
AnonymizedUTCUnix	int64		<input type="checkbox"/>	
CustomerId	int32	Customer ID	<input type="checkbox"/>	

### 3.1.2 CustomerByID: Tixly Customer by ID

Fetches a specific customer by his customer ID

Catalog: Tixly

Schema: Customer

Label: Customer by ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerByID. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		Id of the customer

## Columns of Table Function

The columns of the table function CustomerByID are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
AddressOne	string	Address One	<input type="checkbox"/>	
AddressTwo	string	Address Two	<input type="checkbox"/>	
AlternativeEmails	string	Alternative Email Addresses	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
City	string	City	<input type="checkbox"/>	
CompanyName	string	Company Name	<input type="checkbox"/>	
Country	string	Country	<input type="checkbox"/>	
CountryCode	string	Country Code	<input type="checkbox"/>	
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
CRN	string	CRN	<input type="checkbox"/>	
DateOfBirth	datetime	Date of Birth	<input type="checkbox"/>	
DateOfBirthUTCUnix	int64		<input type="checkbox"/>	
DeletedDate	datetime	Deleted Date	<input type="checkbox"/>	
DeletedDateUTCUnix	int64		<input type="checkbox"/>	
Description	string	Description	<input type="checkbox"/>	
Disallow Merge	boolean	Disallow Merge	<input type="checkbox"/>	
Edited	datetime	Edited	<input type="checkbox"/>	
EditedUTCUnix	int64		<input type="checkbox"/>	
Email	string	Email	<input type="checkbox"/>	
FirstName	string	First Name	<input type="checkbox"/>	
Gender	int32	Gender	<input type="checkbox"/>	
HomePhone	string	Home Phone	<input type="checkbox"/>	
HouseExtension	string	House Extension	<input type="checkbox"/>	
HouseNumber	string	House Number	<input type="checkbox"/>	
Id	int32	ID	<input type="checkbox"/>	
Initials	string	Initials	<input type="checkbox"/>	
IsAnonymized	boolean	Is Anonymized	<input type="checkbox"/>	
IsDeleted	boolean	Is Deleted	<input type="checkbox"/>	
LanguageId	int32	Language ID	<input type="checkbox"/>	
LastName	string	Last Name	<input type="checkbox"/>	
LastNamePrefix	string	Last Name Prefix	<input type="checkbox"/>	
Latitude	double	Latitude	<input type="checkbox"/>	
Longitude	double	Longitude	<input type="checkbox"/>	
Mobile	string	Mobile	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	
SSN	string	SSN	<input type="checkbox"/>	
StreetName	string	Street Name	<input type="checkbox"/>	
Title	string	Title	<input type="checkbox"/>	
WorkPhone	string	Work Phone	<input type="checkbox"/>	
ZipCode	string	ZIP-code	<input type="checkbox"/>	

### 3.1.3 CustomerDonationSalesByCustomerId: Tixly Customer Donation Sales by Customer ID

Fetches the donations from a specific customer

Catalog: Tixly

Schema: Customer

Label: Customer Donation Sales by Customer ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDonationSalesByCustomerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		Id of the customer

## Columns of Table Function

The columns of the table function CustomerDonationSalesByCustomerId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Abbreviation	string	Abbreviation	<input type="checkbox"/>	
AvailableOnline	boolean	Available Online	<input type="checkbox"/>	
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
Description	string	Description	<input type="checkbox"/>	
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	
Price	double	Price	<input type="checkbox"/>	
Renew DayOfMonth	int32	Renew Day of Month	<input type="checkbox"/>	
Renew MonthOfYear	int32	Renew Month of Year	<input type="checkbox"/>	
ShortDescription	string	Short Description	<input type="checkbox"/>	
Tagline	string	Tagline	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
Vat	double	VAT	<input type="checkbox"/>	

### 3.1.4 CustomerEventSalesAllocationsByCustomerId: Tixly Customer Event Sales Allocations by Customer ID

Fetches the events that a specific customer has bought a ticket to

Catalog: Tixly

Schema: Customer

Label: Customer Event Sales Allocations by Customer ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerEventSalesAllocationsByCustomerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		Id of the customer

## Columns of Table Function

The columns of the table function CustomerEventSalesAllocationsByCustomerId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Abbreviation	string	Abbreviation	<input type="checkbox"/>	
Allocated	int32	Allocated	<input type="checkbox"/>	
AvailableOnline	boolean	Available Online	<input type="checkbox"/>

### 3.1.5 CustomerEventSalesByCustomerId: Tixly Customer Event Sales by Customer ID

Fetches the events that a specific customer has bought a ticket to

Catalog: Tixly

Schema: Customer

Label: Customer Event Sales by Customer ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerEventSalesByCustomerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

### 3.1.13 CustomerProductSalesByCustomerId: Tixly Customer Product Sales by Customer ID

Fetches the products a specific customer has bought

Catalog: Tixly

Schema: Customer

Label: Customer Product Sales by Customer ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerProductSalesByCustomerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		Id of the customer

## Columns of Table Function

The columns of the table function CustomerProductSalesByCustomerId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
CustomerId	int32	Customer ID	<input type="checkbox"/>	
EventId	int32	Event ID	<input type="checkbox"/>	
Online	boolean	Online	<input type="checkbox"/>	
OrderId	int32	Order ID	<input type="checkbox"/>	
OrganisationID	int32	Organization ID	<input type="checkbox"/>	
Price	double	Price	<input type="checkbox"/>	
ProductCount	int32	Product Count	<input type="checkbox"/>	
ProductId	int32	Product ID	<input type="checkbox"/>	
SkinID	int32	Skin ID	<input type="checkbox"/>	

### 3.1.14 Customers: Tixly Customers

Fetches all customers you have access to. Pass in the DateFrom and DateTo query parameters to get customers that have been edited or created in a specific date range.

Catalog: Tixly

Schema: Customer

Label: Customers

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Customers. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

### 3.1.16 CustomerTags: Tixly Customer Tags

Fetches all customer tag to customer connections that you have access to. This can be used with the Get all customer tags endpoint and all fetched customer data to quickly connect the two together.

Catalog: Tixly

Schema: Customer

Label: Customer Tags

This is a read-only table. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Tixly API.

## Table Columns

The columns of the table CustomerTags are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
CustomerId	int32	Customer ID	<input type="checkbox"/>	
TagId	int32	Tag ID	<input type="checkbox"/>	

### 3.1.17 CustomerTags2ByCustomerId: Tixly Customer Tags by Customer ID

Fetches all customer tags on a specific customer. This endpoint is not meant to be called once for every customer in the feed, for that purpose it is much more efficient to use the Get all customer tags customer connection endpoint and link them together that way.

Catalog: Tixly

Schema: Customer

Label: Customer Tags by Customer ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerTags2ByCustomerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		Id of the customer

## Columns of Table Function

The columns of the table function CustomerTags2ByCustomerId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Abbreviation	string	Abbreviation	<input type="checkbox"/>	
Color	string	Color	<input type="checkbox"/>

### 3.1.23 MergedCustomerOperationContents

Gets merged customers details.

Catalog: Tixly

Schema: Customer

This is a read-only table. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table MergedCustomerOperationContents are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
MasterCustomerId	int32	Master Customer ID	<input type="checkbox"/>	
Merged	datetime	Merged	<input type="checkbox"/>	
MergedUTCUnix	int64		<input type="checkbox"/>	
TEXT	int32	Text	<input type="checkbox"/>	

### 3.1.24 MergedCustomerOperations

Gets merged customers details.

Catalog: Tixly

Schema: Customer

This is a read-only table. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table MergedCustomerOperations are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
MasterCustomerId	int32	Master Customer ID	<input type="checkbox"/>	
Merged	datetime	Merged	<input type="checkbox"/>	
MergedUTCUnix	int64		<input type="checkbox"/>	

### 3.1.25 SaleMetadataRange: Tixly Sale Metadata Range

Fetches customers by sale range, which means if the customer buys or is refunded an order in the date range it will be included. This endpoint is good to use if you are fetching from other endpoints by a specific date range, that can be matched in this endpoint to link the data. The dates are to and from and include time as well so if you would like an entire day then you need to indicate the end time of that day or the start of the next as the DateTo parameter.

Catalog: Tixly

Schema: Customer

Label: Sale Metadata Range

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SaleMetadataRange. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

### 5.1.3 EventAllocationsByEventId: Tixly Event Allocations by Event ID

Fetches all allocations for a specific events

Catalog: Tixly

Schema: Event

Label: Event Allocations by Event ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EventAllocationsByEventId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		date of the specific event

## Columns of Table Function

The columns of the table function `EventAllocationsByEventId` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Abbreviation	string	Abbreviation	<input type="checkbox"/>	
Block	boolean	Block	<input type="checkbox"/>	
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
ExpiresHoursBefore	int32	Expires Hours Before	<input type="checkbox"/>	
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	
ReservedTickets	int32	Reserved Tickets	<input type="checkbox"/>	
Seats	int32	Seats	<input type="checkbox"/>	
SoldTickets	int32	Sold Tickets	<input type="checkbox"/>	

### 5.1.4 EventCategories: Tixly Event Categories

Fetches all events you have access to.

Catalog: Tixly

Schema: Event

Label: Event Categories

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table `NativePlatformScalarRequests` to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EventCategories`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select \* from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
EditedFrom	datetime	<input type="checkbox"/>		Get events edited after this date
EditedTo	datetime	<input type="checkbox"/>		Get events edited before this date
SoldFrom	datetime	<input type="checkbox"/>		If this is set, then only get sales after this date
SoldTo	datetime	<input type="checkbox"/>		If this is set, then only get sales before this date
StartFrom	datetime	<input type="checkbox"/>		Get events that start after this date
StartTo	datetime	<input type="checkbox"/>		get events that start before this date

## Columns of Table Function

The columns of the table function EventCategories are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

Venue	string	Venue	<input type="checkbox"/>	
VenueId	int32	Venue ID	<input type="checkbox"/>	

### 5.1.5 EventCategories1: Tixly Event Categories

Fetches all events categories you have access to. The categories are returned with a list of IDs of the events they are connected to.

Catalog: Tixly

Schema: Event

Label: Event Categories

This is a read-only table. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table EventCategories1 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	

### 5.1.6 EventCategoriesData: Tixly Event Categories Data

Fetches all events categories you have access to. The categories are returned with a list of IDs of the events they are connected to.

Catalog: Tixly

Schema: Event

Label: Event Categories Data

This is a read-only table. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table EventCategoriesData are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	
TEXT	int32	Text	<input type="checkbox"/>	

### 5.1.7 EventCustomerPlusMetadataById: Tixly Event Customer plus Metadata by ID

Fetches the customers that have bought tickets in a specific event

Catalog: Tixly

Schema: Event

Label: Event Customer plus Metadata by ID

This is a read-only table function. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EventCustomerPlusMetadataById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		date of the specific event

## Columns of Table Function

The columns of the table function EventCustomerPlusMetadataById are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
AddressOne	string	Address One	<input type="checkbox"/>	
AddressTwo	string	Address Two	<input type="checkbox"/>	
AlternativeEmails	string	Alternative Email Addresses	<input type="checkbox"/>

### 5.1.13 EventTags1: Tixly Event Tags

Fetches all events tags you have access to. The tags are returned with a list of IDs of the events they are connected to.

Catalog: Tixly

Schema: Event

Label: Event Tags

This is a read-only table. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table EventTags1 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	

### 5.1.14 EventTagsData: Tixly Event Tags Data

Fetches all events tags you have access to. The tags are returned with a list of IDs of the events they are connected to.

Catalog: Tixly

Schema: Event

Label: Event Tags Data

This is a read-only table. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table EventTagsData are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	
TEXT	int32	Text	<input type="checkbox"/>	

### 5.1.15 EventTickets: Tixly Event Tickets

Fetches all the tickets that you have access to, pass in the SoldFrom and SoldTo to get tickets sold within a specific date range

Catalog: Tixly

Schema: Event

Label: Event Tickets

This is a read-only table function. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EventTickets. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
SoldFrom	datetime	<input type="checkbox"/>		If this is set, then only get sales after this date
SoldTo	datetime	<input type="checkbox"/>		If this is set, then only get sales before this date

## Columns of Table Function

The columns of the table function EventTickets are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
CustomerId	int32	Customer ID	<input type="checkbox"/>	
Entrance	string	Entrance	<input type="checkbox"/>	
EventId	int32	Event ID	<input type="checkbox"/>	
Fee	double	Fee	<input type="checkbox"/>	
IsAnonymousSale	boolean	Is Anonymous Sale	<input type="checkbox"/>	
Online	boolean	Online	<input type="checkbox"/>	
OrderId	int32	Order ID	<input type="checkbox"/>	
OrganisationID	int32	Organization ID	<input type="checkbox"/>	
Price	double	Price	<input type="checkbox"/>	
PriceZone	string	Price Zone	<input type="checkbox"/>	
PriceZoneId	int32	Price Zone ID	<input type="checkbox"/>	
Row	string	Row	<input type="checkbox"/>	
Scanned	boolean	Scanned	<input type="checkbox"/>	
Seat	string	Seat	<input type="checkbox"/>	
Section	string	Section	<input type="checkbox"/>	
SkinID	int32	Skin ID	<input type="checkbox"/>	
SubscriptionTypeId	int32	Subscription Type ID	<input type="checkbox"/>	
TicketCount	int32	Ticket Count	<input type="checkbox"/>	
TicketId	int32	Ticket ID	<input type="checkbox"/>	
TicketType	string	Ticket Type	<input type="checkbox"/>	
TicketTypeId	int32	Ticket Type ID	<input type="checkbox"/>	

### 5.1.16 EventTicketsByEventId: Tixly Event Tickets by Event ID

Fetches tickets sold to a specific event

Catalog: Tixly

Schema: Event

Label: Event Tickets by Event ID

This is a read-only table function. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EventTicketsByEventId`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		date of the specific event

## Columns of Table Function

The columns of the table function `EventTicketsByEventId` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
CustomerId	int32	Customer ID	<input type="checkbox"/>

SubscriptionTypeId	int32	Subscription Type ID	<input type="checkbox"/>	
TicketCount	int32	Ticket Count	<input type="checkbox"/>	
TicketId	int32	Ticket ID	<input type="checkbox"/>	
TicketType	string	Ticket Type	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
TicketTypeId	int32	Ticket Type ID	<input type="checkbox"/>	

### 5.1.17 FutureEventAllocations: Tixly Future Event Allocations

Fetches events you have access to that have a start date in the future.

Catalog: Tixly

Schema: Event

Label: Future Event Allocations

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function FutureEventAllocations. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Season	string	Season	<input type="checkbox"/>	
SubTitle	string	Subtitle	<input type="checkbox"/>	

### 6.1.2 EventGroupById: Tixly Event Group by ID

Gets a specific event group by it's ID

Catalog: Tixly

Schema: EventGroup

Label: Event Group by ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EventGroupById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id	int32	<input checked="" type="checkbox"/>		ID of the specific event group

## Columns of Table Function

The columns of the table function EventGroupById are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
AvailableOnline	boolean	Available Online	<input type="checkbox"/>	
Created	datetime	Created	<input type="checkbox"/>	
CreatedUTCUnix	int64		<input type="checkbox"/>	
Description	string	Description	<input type="checkbox"/>	
Edited	datetime	Edited	<input type="checkbox"/>

Season	string	Season	<input type="checkbox"/>	
SubTitle	string	Subtitle	<input type="checkbox"/>	

### 6.1.3 EventGroupEventAllocationsByEventGroupId: Tixly Event Group Allocations by Event Group ID

Gets all the events within the event group

Catalog: Tixly

Schema: EventGroup

Label: Event Group Allocations by Event Group ID

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EventGroupEventAllocationsByEventGroupId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

## 9 Schema: Native

### 9.1 Tables

#### 9.1.1 NATIVEPLATFORMSCALARREQUESTS: Tixly Native Platform Scalar Requests

{res:itgen\_native\_platform\_scalar\_requests\_desc}

Catalog: Tixly

Schema: Native

Alias: npt

Label: Native Platform Scalar Requests

Documentation:

The NativePlatformScalarRequests table provides direct access to the native API protocol over an established connection to the Tixly API server. It will contain a new row for every row inserted with a native API request in PAYLOAD\_TEXT with the results of unaltered forwarding of the payload to the Tixly API server.

Retrieve: true

Insert: true

Update: false

Delete: false

### View Columns

The columns of the view NATIVEPLATFORMSCALARREQUESTS are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
BLOB_PREFERRED	boolean	BLOB Preferred	<input checked="" type="checkbox"/>	Indicator whether a BLOB result is preferred over text.
BOL_RESPONSE_CACHE_MAX_AGE_SEC	int32	Response Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of Bridge Online response cache entries to be used.
CONTENT_TYPE	string(240)	Content Type	<input type="checkbox"/>	
DATE_ENDED	datetime	End Date	<input checked="" type="checkbox"/>	
DATE_STARTED	datetime	Start Date	<input checked="" type="checkbox"/>	
DRY_RUN	boolean	Run without Actions	<input checked="" type="checkbox"/>	
DURATION_MS	int32	Duration (ms)	<input checked="" type="checkbox"/>	
ERROR_MESSAGE_CODE	string(30)	Error Message Code	<input type="checkbox"/>	
ERROR_MESSAGE_TEXT	string(32000)	Error Message Text	<input type="checkbox"/>	
FAIL_ON_ERROR	boolean	Fail on Error	<input checked="" type="checkbox"/>	Whether to raise an exception when processing the native request triggered an error from the provider.
HTTP_DISK_CACHE_MAX_AGE_SEC	int32	HTTP Disk Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of HTTP disk cache entries to be used.

Name	Data Type	Label	Required	Documentation
HTTP_DISK_CACHE_SAVE	boolean	Save HTTP Disk Cache	<input type="checkbox"/>	Whether results can be stored in HTTP disk cache.
HTTP_DISK_CACHE_USE	boolean	Use HTTP Disk Cache	<input type="checkbox"/>	Whether results can be fetched from HTTP disk cache.
HTTP_MEMORY_CACHE_MAX_AGE_SEC	int32	HTTP Memory Cache Maximum Age (sec)	<input type="checkbox"/>	Maximum age in seconds of HTTP memory cache entries to be used.
HTTP_MEMORY_CACHE_SAVE	boolean	Save HTTP Memory Cache	<input type="checkbox"/>	Whether results can be stored in HTTP memory cache.
HTTP_MEMORY_CACHE_USE	boolean	Use HTTP Memory Cache	<input type="checkbox"/>	Whether results can be fetched from HTTP memory cache.
HTTP_METHOD	string(30)	HTTP Method	<input type="checkbox"/>	
HTTP_STATUS_CODE	int16	HTTP Status Code	<input type="checkbox"/>	
ORIG_SYSTEM_GROUP	string(4000)	Original System Group	<input type="checkbox"/>	
ORIG_SYSTEM_REFERENCE	string(4000)	Original System Reference	<input type="checkbox"/>	
PAYLOAD_TEXT	string	Payload	<input type="checkbox"/>	
RESULT_BLOB	byte[]	Result BLOB	<input type="checkbox"/>	
RESULT_DATE_TIME_UTC	datetime	Result Date Time	<input type="checkbox"/>	
RESULT_NUMBER	decimal	Result Number	<input type="checkbox"/>	
RESULT_TEXT	string	Result Text	<input type="checkbox"/>	
SUCCESSFUL	boolean	Successful	<input checked="" type="checkbox"/>	
TIMEOUT_SEC	int32	Timeout (sec)	<input type="checkbox"/>	Timeout in seconds.
TRANSACTION_ID	int32	Transaction ID	<input checked="" type="checkbox"/>	Incrementing ID of the transaction.
URL	string(4000)	URL	<input type="checkbox"/>	

## 10 Schema: Permission

### 10.1 Tables

#### 10.1.1 DeletedPermissions: Tixly Deleted Permissions

Fetches all deleted permission types.

Catalog: Tixly

Schema: Permission

Label: Deleted Permissions

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

### Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DeletedPermissions. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a

pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
DateFrom	datetime	<input type="checkbox"/>		Deleted permission types from
DateTo	datetime	<input type="checkbox"/>		Deleted permission types to

### 13.1.4 DeletedTags: Tixly Deleted Tags

Fetches all deleted customer tags you have access to.

Catalog: Tixly

Schema: Tag

Label: Deleted Tags

This is a read-only table function. The Tixly API may not support changing the data or the Invariantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DeletedTags. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
DateFrom	datetime	<input type="checkbox"/>		Deleted customer tag from
DateTo	datetime	<input type="checkbox"/>		Deleted customer tag to

## Columns of Table Function

The columns of the table function DeletedTags are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
Abbreviation	string	Abbreviation	<input type="checkbox"/>	
Color	string	Color	<input type="checkbox"/>	
Deleted	datetime	Deleted	<input type="checkbox"/>	
DeletedUTCUnix	int64		<input type="checkbox"/>	
Icon	string	Icon	<input type="checkbox"/>	
Id	int32	ID	<input type="checkbox"/>	
Name	string	Name	<input type="checkbox"/>	

### 13.1.5 Tags: Tixly Tags

Fetches all customer tags that you have access to.

Catalog: Tixly

Schema: Tag

Label: Tags

This is a read-only table. The Tixly API may not support changing the data or the Invantive SQL driver for Tixly does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Tixly API.

## Table Columns

The columns of the table Tags are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
