27.1.9 CustomerDebitNoteLinesByNumber: Visma.net Financials Customer Debit Note Lines by Number

Get a specific Customer Debit NoteData for Customer Debit Note

Catalog: VismaNet

Schema: CustomerDebitNote

Label: Customer Debit Note Lines by Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter

case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDebitNoteLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
debitNoteNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Debit Note
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

Columns of Table Function

The columns of the table function CustomerDebitNoteLinesByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class & The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class & The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class & The name of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class & The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item

Name	Data Type	Label	Required	Documentation
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type_1	string		<input type="checkbox"/>	Account & The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
amount_1	double		<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount & The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_1	double		<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_number_1	string		<input type="checkbox"/>	Click the magnifier. & The identifier.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. & The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab & The payment information section & Cash account & The cash

Name	Data Type	Label	Required	Documentation
				account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The Top part > Cash discount date* > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.

debitNoteNumber	string	<input checked="" type="checkbox"/>		Identifies the customer debit note
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

Columns of Table Function

The columns of the table function CustomerDebitNotePrintByDebitNoteNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
DUMMY	string(1)	Dummy	<input checked="" type="checkbox"/>	Default column added since the specification specifies that no data is returned.

27.1.11 CustomerDebitNotes: Visma.net Financials Customer Debit Notes

Get a range of Customer Debit Notes - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for Customer Debit Note

Catalog: VismaNet

Schema: CustomerDebitNote

Label: Customer Debit Notes

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDebitNotes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
customerRefNumber	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
documentDueDate	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
documentType	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Waarden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=amp;lt;) OR after and including (=amp;gt;) to filter on time frame.
dunningLevel	int32	<input type="checkbox"/>		The dunning level of the document.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system

Name	Data Type	Required	Default Value	Documentation
				will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

27.1.13 CustomerDebitNoteTaxDetailsByDebitNoteNumber: Visma.net Financials Customer Debit Note Tax Details by Debit Note Number

Get a specific Customer Debit NoteData for Customer Debit Note

Catalog: VismaNet

Schema: CustomerDebitNote

Label: Customer Debit Note Tax Details by Debit Note Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDebitNoteTaxDetailsByDebitNoteNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
debitNoteNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Debit Note
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint

Name	Data Type	Required	Default Value	Documentation
				itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

Columns of Table Function

The columns of the table function CustomerDebitNoteTaxDetailsByDebitNoteNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.
amount	double	Amount	<input type="checkbox"/>	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part > Balance > For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section >

Name	Data Type	Label	Required	Documentation
				Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The Top part > Cash discount date* > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.

29 Schema: CustomerInvoice

29.1 Tables

29.1.1 CustomerInvoiceApplications: Visma.net Financials Customer Invoice Applications

Get a range of Invoices - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced paginationData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Applications

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceApplications. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.

vatExemptTotal	double	VAT Exempt Total	<input type="checkbox"/>	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax with the Include in VAT Exempt Total check box selected on the Taxes form. This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.
voided	boolean		<input type="checkbox"/>	

29.1.2 CustomerInvoiceApplicationsByInvoiceNumber: Visma.net Financials Customer Invoice Applications by Invoice Number

Get a specific InvoiceData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Applications by Invoice Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter

case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceApplicationsByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
invoiceNumber	string	<input checked="" type="checkbox"/>		Identifies the Invoice

Columns of Table Function

The columns of the table function CustomerInvoiceApplicationsByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.
accountingCostRef	string		<input type="checkbox"/>	
amount	double	Amount	<input type="checkbox"/>	The top part > Amount > The amount paid by the document. The value appears for

Name	Data Type	Label	Required	Documentation
				new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
amountPaid	double	Amount Paid	<input type="checkbox"/>	
applicationDate	datetime	Application Date	<input type="checkbox"/>	
applicationPeriod	string	Application Period	<input type="checkbox"/>	
balance_1	double		<input type="checkbox"/>	The top part > Balance > For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balance	double	Balance	<input type="checkbox"/>	
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.

29.1.4 CustomerInvoiceAttachmentsByInvoiceNumber: Visma.net Financials Customer Invoice Attachments by Invoice Number

Get a specific InvoiceData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Attachments by Invoice Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceAttachmentsByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
invoiceNumber	string	<input checked="" type="checkbox"/>		Identifies the Invoice

Columns of Table Function

The columns of the table function CustomerInvoiceAttachmentsByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item

Name	Data Type	Label	Required	Documentation
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
accountingCostRef	string		<input type="checkbox"/>	
amount	double	Amount	<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .if the check box is cleared, then the value appears when the document status is Open.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. & The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab & The payment information section & Cash account & The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part & Cash discount & The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part & Cash discount date * & The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given

29.1.6 CustomerInvoiceLineAttachments: Visma.net Financials Customer Invoice Line Attachments

Get a range of Invoices - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced paginationData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Line Attachments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter

case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLineAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
customerRefNumber	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
documentDueDate	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
documentType	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Waarden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=amp;lt;) OR after and including (=amp;gt;) to filter on time frame.
dunningLevel	int32	<input type="checkbox"/>		The dunning level of the document.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and

Name	Data Type	Required	Default Value	Documentation
				executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandApplications	boolean	<input type="checkbox"/>		True if you want to see all dunning information regarding this document.
expandAttachments	boolean	<input type="checkbox"/>		True if you want to see all attachments regarding this document.
expandDunningInformation	boolean	<input type="checkbox"/>		
expandInvoiceAddress	boolean	<input type="checkbox"/>		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails	boolean	<input type="checkbox"/>		True if you want to see all VAT details regarding this document.
externalReference	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	<input type="checkbox"/>		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max

vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

29.1.7 CustomerInvoiceLineAttachmentsByInvoiceNumber: Visma.net Financials Customer Invoice Line Attachments by Invoice Number

Get a specific InvoiceData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Line Attachments by Invoice Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLineAttachmentsByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
invoiceNumber	string	<input checked="" type="checkbox"/>		Identifies the Invoice

Columns of Table Function

The columns of the table function CustomerInvoiceLineAttachmentsByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class > The name of the account class.

Name	Data Type	Label	Required	Documentation
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class & The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type_1	string		<input type="checkbox"/>	Account & The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
accountingCostRef	string		<input type="checkbox"/>	
amount_1	double		<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount & The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_1	double		<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_number_1	string		<input type="checkbox"/>	Click the magnifier. & The identifier.

Name	Data Type	Label	Required	Documentation
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part > Cash discount date * > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
contact_id	int32	Contact ID	<input type="checkbox"/>	Click the magnifier > The identifier
contact_name	string	Contact Name	<input type="checkbox"/>	Click the magnifier > The displayed name
contractDocRef	string		<input type="checkbox"/>	
cost	double	Cost	<input type="checkbox"/>	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	<input type="checkbox"/>	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	string	Credit Terms Description	<input type="checkbox"/>	Click on the magnifier. > The description.
creditTerms_id	string	Credit Terms ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
currencyId	string	Currency ID	<input type="checkbox"/>	The top part > Currency > The currency of the document. By default, it is the customer's default currency, but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.
customer_name	string	Customer Name	<input type="checkbox"/>	Click the magnifier. > The name.

Name	Data Type	Label	Required	Documentation
customer_number	string	Customer Number	<input type="checkbox"/>	
customerProject	string		<input type="checkbox"/>	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	string	Custom Reference Number	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
customerVatZone_description	string	VAT Zone Description	<input type="checkbox"/>	Click on the magnifier. > The description.
customerVatZone_id	string	VAT Zone ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
deductableAmount	double		<input type="checkbox"/>	
deferralCode	string		<input type="checkbox"/>	The deferral code assigned to the stock item or non-stock item specified in this document line. Upon release of the document, the system generates a deferral schedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		<input type="checkbox"/>	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It shows the identifier of the deferral schedule associated with the original Cash sale document.
description	string	Description	<input type="checkbox"/>	Transaction descr. > Any brief comment relevant to the transaction. The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	<input type="checkbox"/>	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	<input type="checkbox"/>	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		<input type="checkbox"/>	Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line. The system selects the Manual Discount check box and calculates the line amount after you have entered the discount amount manually and save your changes or added a new line.
discountAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Discount amount in your default currency. This field is

Name	Data Type	Label	Required	Documentation
				applicable if the amount is given in another currency than your default.
discountCode	string	Discount Code	<input type="checkbox"/>	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	<input type="checkbox"/>	Discount percent > The percent of the line-level discount that has been applied manually or automatically. The system selects the Manual Discount check box and calculates the discount amount after you have entered the percent manually and saved your changes or added a new line.
discountTotal	double	Discount Total	<input type="checkbox"/>	The top part > Discount total > The document discount total.
discountTotalInCurrency	double		<input type="checkbox"/>	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	<input type="checkbox"/>	The top part > Date* > The date when the customer ledger document was created. By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	<input type="checkbox"/>	Mandatory field: The top part > Due date* > The date when payment for the document is due, in accordance with the credit terms.
documentType	string	Document Type	<input type="checkbox"/>	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	boolean	Don't Email	<input type="checkbox"/>	
dontPrint	boolean	Don't Print	<input type="checkbox"/>	
dunningLetterDate	datetime	Dunning Letter Date	<input type="checkbox"/>	The Financial details tab > The dunning info section > Dunning letter date > The date of the last released dunning letter in which the document was listed.
dunningLetterLevel	int32	Dunning Letter Level	<input type="checkbox"/>	The Financial details tab > The dunning info section > Dunning level > The dunning level of the document.
endDate_1	datetime		<input type="checkbox"/>	
endDate	datetime	End Date	<input type="checkbox"/>	
errorInfo	string	Error Message	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
exchangeRate	double	Exchange Rate	<input type="checkbox"/>	
externalLink	string		<input type="checkbox"/>	
externalReference	string	External Reference	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	Financial Period	<input type="checkbox"/>	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	boolean	Hold	<input type="checkbox"/>	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
id	guid	ID	<input type="checkbox"/>	The ID of the attachment
inventoryNumber	string	Inventory Number	<input type="checkbox"/>	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	<input type="checkbox"/>	
invoiceAddress_addressLine1	string	Invoice Address Line 1	<input type="checkbox"/>	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	string	Invoice Address Line 2	<input type="checkbox"/>	Address 2 > The second line of the address.
invoiceAddress_addressLine3	string	Invoice Address Line 3	<input type="checkbox"/>	Address 3 > The third line of the address.
invoiceAddress_city	string	Invoice Address City	<input type="checkbox"/>	City > The city.
invoiceAddress_country_errorInfo	string		<input type="checkbox"/>	
invoiceAddress_country_id	string	Invoice Address Country ID	<input type="checkbox"/>	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		<input type="checkbox"/>	
invoiceAddress_country_metadata_totalCount	int64		<input type="checkbox"/>	
invoiceAddress_country_name	string	Invoice Address Country Name	<input type="checkbox"/>	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	string	Invoice Address County ID	<input type="checkbox"/>	Click the magnifier > The identifier
invoiceAddress_county_name	string	Invoice Address County Name	<input type="checkbox"/>	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	boolean		<input type="checkbox"/>	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	string	Invoice Address Postal Code	<input type="checkbox"/>	Postcode > The postcode.
invoiceContact_attention	string	Invoice Contact Attention	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
invoiceContact_businessName	string		<input type="checkbox"/>

subaccount_subaccountNumber	string	Sub Account Number	<input type="checkbox"/>	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
termEndDate	datetime	Term End Date	<input type="checkbox"/>	Term end date > The date when the process of the deferred revenue recognition should finish for the selected item; this date can be specified manually if the deferral code assigned to the item is based on the Flexible by periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) window .
termStartDate	datetime	Term Start Date	<input type="checkbox"/>	Term start date > The date when the process of deferred revenue recognition should start for the selected item; this date can be specified manually if the deferral code assigned to the item is based on the Flexible by periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) window .
typeOfWork_description	string		<input type="checkbox"/>	
typeOfWork_rutRotType	string		<input type="checkbox"/>	
typeOfWork_xmlTag	string		<input type="checkbox"/>	
unitPrice	double		<input type="checkbox"/>	Unit price > The unit price set for the item or service. If you want to update the unit priceautomatically to the current value(that is, the applicable sales or default price),you can use the Recalculate Prices and Discounts action.If you have

Name	Data Type	Label	Required	Documentation
				modified the unit price and saved the document, the value will not be updated by the system if you change the document date.
unitPriceInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Unit price in your default currency. This field is applicable if the amount is given in another currency than your default.
uom	string	Unit of Measure	<input type="checkbox"/>	UoM > The unit of measure (UoM) for the item.
vatCode_description	string	VAT Code Description	<input type="checkbox"/>	Click on the magnifier. > The description.
vatCode_id	string	VAT Code ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	<input type="checkbox"/>	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax with the Include in VAT Exempt Total check box selected on the Taxes form. This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

29.1.8 CustomerInvoiceLines: Visma.net Financials Customer Invoice Lines

Get a range of Invoices - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested

page size is greater than allowed max page size, request will be limited to max page size
 sizeChange log:2020-May:Added forced paginationData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Lines

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
customerRefNumber	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
documentDueDate	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
documentType	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Waarden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)

Name	Data Type	Required	Default Value	Documentation
dunningLetterDateTime	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=<) OR after and including (=>) to filter on time frame.
dunningLevel	int32	<input type="checkbox"/>		The dunning level of the document.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandApplications	boolean	<input type="checkbox"/>		True if you want to see all dunning information regarding this document.
expandAttachments	boolean	<input type="checkbox"/>		True if you want to see all attachments regarding this document.
expandDunningInformation	boolean	<input type="checkbox"/>		
expandInvoiceAddress	boolean	<input type="checkbox"/>		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails	boolean	<input type="checkbox"/>		True if you want to see all VAT details regarding this document.
externalReference	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	<input type="checkbox"/>		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with

Name	Data Type	Required	Default Value	Documentation
				NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
paymentReference	string	<input type="checkbox"/>		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance with the number series assigned to cash sales in the Customer ledger preferences window ..
project	string	<input type="checkbox"/>		The project with which the document is associated.
released	int32	<input type="checkbox"/>		Parameter for showing if invoice has been released or not.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
status	string	<input type="checkbox"/>		The status of the document. Use the dropdown to select status. (Waarden: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerInvoiceLines are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.

Name	Data Type	Label	Required	Documentation
account_externalCode2_1	string		<input type="checkbox"/>	Account class & The name of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class & The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type_1	string		<input type="checkbox"/>	Account & The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
accountingCostRef	string		<input type="checkbox"/>	
amount_1	double		<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount & The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_1	double		<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. & The name.

Name	Data Type	Label	Required	Documentation
branchNumber_number_1	string		<input type="checkbox"/>	Click the magnifier. > The identifier.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part > Cash discount date * > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
contact_id	int32	Contact ID	<input type="checkbox"/>	Click the magnifier > The identifier
contact_name	string	Contact Name	<input type="checkbox"/>	Click the magnifier > The displayed name
contractDocRef	string		<input type="checkbox"/>	
cost	double	Cost	<input type="checkbox"/>	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	<input type="checkbox"/>	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	string	Credit Terms Description	<input type="checkbox"/>	Click on the magnifier. > The description.
creditTerms_id	string	Credit Terms ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
currencyId	string	Currency ID	<input type="checkbox"/>	The top part > Currency > The currency of the document. By default, it is the customer's default currency, but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.

Name	Data Type	Label	Required	Documentation
customer_name	string	Customer Name	<input type="checkbox"/>	Click the magnifier. > The name.
customer_number	string	Customer Number	<input type="checkbox"/>	
customerProject	string		<input type="checkbox"/>	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	string	Custom Reference Number	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
customerVatZone_description	string	VAT Zone Description	<input type="checkbox"/>	Click on the magnifier. > The description.
customerVatZone_id	string	VAT Zone ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
deductableAmount	double		<input type="checkbox"/>	
deferralCode	string		<input type="checkbox"/>	The deferral code assigned to the stock item or non-stock item specified in this document line. Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		<input type="checkbox"/>	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It shows the identifier of the deferral schedule associated with the original Cash sale document.
description	string	Description	<input type="checkbox"/>	Transaction descr. > Any brief comment relevant to the transaction. The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	<input type="checkbox"/>	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	<input type="checkbox"/>	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		<input type="checkbox"/>	Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line. The system selects the Manual Discount check box and calculates the line amount after you have entered the discount amount manually and save your changes or added a new line.

Name	Data Type	Label	Required	Documentation
discountAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	string	Discount Code	<input type="checkbox"/>	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	<input type="checkbox"/>	Discount percent > The percent of the line-level discount that has been applied manually or automatically. The system selects the Manual Discount check box and calculates the discount amount after you have entered the percent manually and saved your changes or added a new line.
discountTotal	double	Discount Total	<input type="checkbox"/>	The top part > Discount total > The document discount total.
discountTotalInCurrency	double		<input type="checkbox"/>	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	<input type="checkbox"/>	The top part > Date* > The date when the customer ledger document was created. By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	<input type="checkbox"/>	Mandatory field: The top part > Due date* > The date when payment for the document is due, in accordance with the credit terms.
documentType	string	Document Type	<input type="checkbox"/>	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	boolean	Don't Email	<input type="checkbox"/>	
dontPrint	boolean	Don't Print	<input type="checkbox"/>	
dunningLetterDate	datetime	Dunning Letter Date	<input type="checkbox"/>	The Financial details tab > The dunning info section > Dunning letter date > The date of the last released dunning letter in which the document was listed.
dunningLetterLevel	int32	Dunning Letter Level	<input type="checkbox"/>	The Financial details tab > The dunning info section > Dunning level > The dunning level of the document.
endDate_1	datetime		<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
endDate	datetime	End Date	<input type="checkbox"/>	
errorInfo	string	Error Message	<input type="checkbox"/>	
exchangeRate	double	Exchange Rate	<input type="checkbox"/>	
externalLink	string		<input type="checkbox"/>	
externalReference	string	External Reference	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	Financial Period	<input type="checkbox"/>	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	boolean	Hold	<input type="checkbox"/>	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
inventoryNumber	string	Inventory Number	<input type="checkbox"/>	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	<input type="checkbox"/>	
invoiceAddress_addressLine1	string	Invoice Address Line 1	<input type="checkbox"/>	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	string	Invoice Address Line 2	<input type="checkbox"/>	Address 2 > The second line of the address.
invoiceAddress_addressLine3	string	Invoice Address Line 3	<input type="checkbox"/>	Address 3 > The third line of the address.
invoiceAddress_city	string	Invoice Address City	<input type="checkbox"/>	City > The city.
invoiceAddress_country_errorInfo	string		<input type="checkbox"/>	
invoiceAddress_country_id	string	Invoice Address Country ID	<input type="checkbox"/>	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		<input type="checkbox"/>	
invoiceAddress_country_metadata_totalCount	int64		<input type="checkbox"/>	
invoiceAddress_country_name	string	Invoice Address Country Name	<input type="checkbox"/>	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	string	Invoice Address County ID	<input type="checkbox"/>	Click the magnifier > The identifier
invoiceAddress_county_name	string	Invoice Address County Name	<input type="checkbox"/>	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	boolean		<input type="checkbox"/>	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	string	Invoice Address Postal Code	<input type="checkbox"/>	Postcode > The postcode.

Name	Data Type	Label	Required	Documentation
invoiceContact_attention	string	Invoice Contact Attention	<input type="checkbox"/>	
invoiceContact_businessName	string		<input type="checkbox"/>	
invoiceContact_contactId	int32	Invoice Contact ID	<input type="checkbox"/>	
invoiceContact_email	string	Invoice Contact Email Address	<input type="checkbox"/>	
invoiceContact_overrideContact	boolean		<input type="checkbox"/>	
invoiceContact_phone1	string	Invoice Contact Phone 1	<input type="checkbox"/>	
invoiceText	string	Invoice Text	<input type="checkbox"/>	The top part > Invoice text > Any user-provided description of the customer ledger document.
isRotRutDeductible_1	boolean		<input type="checkbox"/>	The top part > Domestic services deductible document > A check box indicating if the document is Rot/rut deductible (applicable for the Sw edish markets)
isRotRutDeductible	boolean		<input type="checkbox"/>	
itemType	string	Item Type	<input type="checkbox"/>	
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	System generated field for last modification date/time of document.
lineNumber	int32	Line Number	<input type="checkbox"/>	Line no. > A counter of lines in the overview of cash sales document overview .
lineType	string	Line Type	<input type="checkbox"/>	Transaction line type.Possible Values:-> Inventory = "GI";-> NonInventory = "GN";-> MiscCharge = "MI";-> Freight = "FR";-> Discount = "DS";-> Reallocation = "RA";
location_countryId	string	Location Country ID	<input type="checkbox"/>	Location*.
location_id	string	Location ID	<input type="checkbox"/>	Click the magnifier > The identifier
location_name	string	Location Name	<input type="checkbox"/>	Click the magnifier > The displayed name
manualAmount	double	Manual Amount	<input type="checkbox"/>	Manual amount > a check box indicating that the amount has been entered manually.
manualAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Manual amount in your default currency. This field is applicable if the amount is given in another currency than your default.
manualDiscount	boolean		<input type="checkbox"/>	Manual discount > A check box that indicates (if selected) that the discount has been appliedmanually.If you clear the check box, the system clears entered discount percent,or

Name	Data Type	Label	Required	Documentation
				discount amount, or selected discount code.
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
note_1	string		<input type="checkbox"/>	Icon Notes on top of the window & Pop-up window for providing any user-defined text connected to the document.
note	string	Note	<input type="checkbox"/>	Table & Icon Notes & Pop-up window for providing any user-defined text connected to the order.
originatorDocRef	string		<input type="checkbox"/>	
origInvoiceDate	datetime	Original Invoice Date	<input type="checkbox"/>	The top part & Orig invoice date & The date based on which the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences. By default, for a new document, it is the current business date, but you can change the date.
paymentMethod_description	string	Payment Method Description	<input type="checkbox"/>	Click on the magnifier. & The description.
paymentMethod_id	string	Payment Method ID	<input type="checkbox"/>	Click on the magnifier. & The identifier.
paymentReference	string	Payment Reference	<input type="checkbox"/>	///The top part & Payment ref. & The reference number of the document, as automatically generated by the system in accordance with the number series assigned to cash sales in the Customer ledger preferences window ..
postPeriod	string	Post Period	<input type="checkbox"/>	The top part & Post period & The period to which the document should be posted. Format YYYYMM.
project_description	string	Project Description	<input type="checkbox"/>	Click on the magnifier. & The description.
project_id	string	Project ID	<input type="checkbox"/>	Click on the magnifier. & The identifier.
projectTask_description	string	Project Task Description	<input type="checkbox"/>	Click on the magnifier. & The description.
projectTask_id	string	Project Task ID	<input type="checkbox"/>	Click on the magnifier. & The identifier.
quantity	double	Quantity	<input type="checkbox"/>	Quantity & The quantity of items (goods or services) of a particular type sold to the customer.
referenceNumber	string	Reference Number	<input type="checkbox"/>	The Top part & Ref. no. & The reference number of the customer ledger document in the system.

Name	Data Type	Label	Required	Documentation
roundingDiff	double	Rounding Difference	<input type="checkbox"/>	The top part > Rounding diff. > The difference between the original amount and the rounded amount.

vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

29.1.9 CustomerInvoiceLinesByInvoiceNumber: Visma.net Financials Customer Invoice Lines by Invoice Number

Get a specific InvoiceData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Lines by Invoice Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLinesByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
invoiceNumber	string	<input checked="" type="checkbox"/>		Identifies the Invoice

Columns of Table Function

The columns of the table function CustomerInvoiceLinesByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class > The name of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.

Get the print report of a Customer InvoiceThe File is in Content of the message

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Print by Reference Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoicePrintByRefNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Schema: CustomerInvoice

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceRotRutDistributionByRefNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the

execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

29.1.15 CustomerInvoiceTaxDetailsByInvoiceNumber: Visma.net Financials Customer Invoice Tax Details by Invoice Number

Get a specific InvoiceData for Customer Invoice

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Tax Details by Invoice Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceTaxDetailsByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
invoiceNumber	string	<input checked="" type="checkbox"/>		Identifies the Invoice

Columns of Table Function

The columns of the table function CustomerInvoiceTaxDetailsByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description

Name	Data Type	Label	Required	Documentation
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.

29.1.16 CustomerInvoiceWorkTypes: Visma.net Financials Customer Invoice Work Types

Get all Work TypesData for the Work Type

Catalog: VismaNet

Schema: CustomerInvoice

Label: Customer Invoice Work Types

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceWorkTypes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default

to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

30.1.3 CustomerOverdueChargeAttachments

Get a range of Customer Overdue Charges - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `CustomerOverdueChargeAttachments`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
<code>closedFinancialPeriod</code>	string	<input type="checkbox"/>		The date of the closing of the financial period.
<code>COMPANY_CODE</code>	string	<input type="checkbox"/>		Partition to retrieve data from.
<code>createdDateTime</code>	string	<input type="checkbox"/>		Creation date and time.
<code>createdDateTimeCondition</code>	string	<input type="checkbox"/>		System-retrieved information for state/condition
<code>customerRefNumber</code>	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
<code>documentDueDate</code>	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
<code>documentType</code>	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Warden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
<code>dunningLetterDateTime</code>	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.
<code>dunningLetterDateTimeCondition</code>	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=<) OR after and including (=>) to filter on time frame.
<code>dunningLevel</code>	int32	<input type="checkbox"/>		The dunning level of the document.
<code>erp-api-background</code>	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with

Name	Data Type	Required	Default Value	Documentation
				a 202-Accepted status and a reference to a state document for the background operation.
expandApplications	boolean	<input type="checkbox"/>		True if you want to see all dunning information regarding this document.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeAttachmentsByOverdueChargeNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by

position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
overdueChargeNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Overdue Charge

Columns of Table Function

The columns of the table function

CustomerOverdueChargeAttachmentsByOverdueChargeNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.
amount	double	Amount	<input type="checkbox"/>	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window. If the check box is cleared, then the value appears when the document status is Open.

Name	Data Type	Label	Required	Documentation
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part > Balance >; For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section >; Cash account >; The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount >; The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part > Cash discount date* >; The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.

vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

30.1.5 CustomerOverdueChargeByOverdueChargeNumber

Get a specific Customer Overdue ChargeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter

case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeByOverdueChargeNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
overdueChargeNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Overdue Charge

Columns of Table Function

This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

30.1.6 CustomerOverdueChargeLineAttachments

Get a range of Customer Overdue Charges - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeLineAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
customerRefNumber	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
documentDueDate	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
documentType	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Waarden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.

Name	Data Type	Required	Default Value	Documentation
dunningLetterDateTimeCondition	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=amp;lt;) OR after and including (=amp;gt;) to filter on time frame.
dunningLevel	int32	<input type="checkbox"/>		The dunning level of the document.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandApplications	boolean	<input type="checkbox"/>		True if you want to see all dunning information regarding this document.
expandAttachments	boolean	<input type="checkbox"/>		True if you want to see all attachments regarding this document.
expandDunningInformation	boolean	<input type="checkbox"/>		
expandInvoiceAddress	boolean	<input type="checkbox"/>		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails	boolean	<input type="checkbox"/>		True if you want to see all VAT details regarding this document.
externalReference	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	<input type="checkbox"/>		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

Name	Data Type	Required	Default Value	Documentation
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
paymentReference	string	<input type="checkbox"/>		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance with the number series assigned to cash sales in the Customer ledger preferences window ..
project	string	<input type="checkbox"/>		The project with which the document is associated.
released	int32	<input type="checkbox"/>		Parameter for showing if invoice has been released or not.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
status	string	<input type="checkbox"/>		The status of the document. Use the dropdown to select status. (Waarden: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerOverdueChargeLineAttachments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class > The name of the account class.

Name	Data Type	Label	Required	Documentation
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class & The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type_1	string		<input type="checkbox"/>	Account & The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
amount_1	double		<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount & The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_1	double		<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. & The name.
branchNumber_number_1	string		<input type="checkbox"/>	Click the magnifier. & The identifier.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. & The identifier.

Name	Data Type	Label	Required	Documentation
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part > Cash discount date* > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
contact_id	int32	Contact ID	<input type="checkbox"/>	Click the magnifier > The identifier
contact_name	string	Contact Name	<input type="checkbox"/>	Click the magnifier > The displayed name
cost	double	Cost	<input type="checkbox"/>	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	<input type="checkbox"/>	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	string	Credit Terms Description	<input type="checkbox"/>	Click on the magnifier. > The description.
creditTerms_id	string	Credit Terms ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
currencyId	string	Currency ID	<input type="checkbox"/>	The top part > Currency > The currency of the document. By default, it is the customer's default currency, but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.
customer_name	string	Customer Name	<input type="checkbox"/>	Click the magnifier. > The name.
customer_number	string	Customer Number	<input type="checkbox"/>	
customerProject	string		<input type="checkbox"/>	The top part > Customer project no. > The customer

Name	Data Type	Label	Required	Documentation
				project no. used in AutoInvoice.
customerRefNumber	string	Custom Reference Number	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
customerVatZone_description	string	VAT Zone Description	<input type="checkbox"/>	Click on the magnifier. > The description.
customerVatZone_id	string	VAT Zone ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
deferralCode	string		<input type="checkbox"/>	The deferral code assigned to the stock item or non-stock item specified in this document line. Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		<input type="checkbox"/>	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It shows the identifier of the deferral schedule associated with the original Cash sale document.
description	string	Description	<input type="checkbox"/>	Transaction descr. > Any brief comment relevant to the transaction. The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	<input type="checkbox"/>	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	<input type="checkbox"/>	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		<input type="checkbox"/>	Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line. The system selects the Manual Discount check box and calculates the line amount after you have entered the discount amount manually and save your changes or added a new line.
discountAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.

Name	Data Type	Label	Required	Documentation
discountCode	string	Discount Code	<input type="checkbox"/>	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	<input type="checkbox"/>	Discount percent > The percent of the line-level discount that has been applied manually or automatically. The system selects the Manual Discount check box and calculates the discount amount after you have entered the percent manually and saved your changes or added a new line.
discountTotal	double	Discount Total	<input type="checkbox"/>	The top part > Discount total > The document discount total.
discountTotalInCurrency	double		<input type="checkbox"/>	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	<input type="checkbox"/>	The top part > Date* > The date when the customer ledger document was created. By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	<input type="checkbox"/>	Mandatory field: The Top part > Due date* > The date when payment for the document is due, in accordance with the credit terms.
documentType	string	Document Type	<input type="checkbox"/>	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	boolean	Don't Email	<input type="checkbox"/>	
dontPrint	boolean	Don't Print	<input type="checkbox"/>	
dunningLetterDate	datetime	Dunning Letter Date	<input type="checkbox"/>	Financial details tab > Dunning information section > Dunning letter date > The date of the last released dunning letter in which the document was listed.
dunningLetterLevel	int32	Dunning Letter Level	<input type="checkbox"/>	Financial details tab > Dunning information section > Dunning level > The dunning level of the document.
errorInfo	string	Error Message	<input type="checkbox"/>	
exchangeRate	double	Exchange Rate	<input type="checkbox"/>	The top part > Currency > The currency of the document.
externalLink	string		<input type="checkbox"/>	
externalReference	string	External Reference	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.

Name	Data Type	Label	Required	Documentation
financialPeriod	string	Financial Period	<input type="checkbox"/>	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	boolean	Hold	<input type="checkbox"/>	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
id	guid	ID	<input type="checkbox"/>	The ID of the attachment
inventoryNumber	string	Inventory Number	<input type="checkbox"/>	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	<input type="checkbox"/>	
invoiceAddress_addressLine1	string	Invoice Address Line 1	<input type="checkbox"/>	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	string	Invoice Address Line 2	<input type="checkbox"/>	Address 2 > The second line of the address.
invoiceAddress_addressLine3	string	Invoice Address Line 3	<input type="checkbox"/>	Address 3 > The third line of the address.
invoiceAddress_city	string	Invoice Address City	<input type="checkbox"/>	City > The city.
invoiceAddress_country_errorInfo	string		<input type="checkbox"/>	
invoiceAddress_country_id	string	Invoice Address Country ID	<input type="checkbox"/>	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		<input type="checkbox"/>	
invoiceAddress_country_metadata_totalCount	int64		<input type="checkbox"/>	
invoiceAddress_country_name	string	Invoice Address Country Name	<input type="checkbox"/>	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	string	Invoice Address County ID	<input type="checkbox"/>	Click the magnifier > The identifier
invoiceAddress_county_name	string	Invoice Address County Name	<input type="checkbox"/>	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	boolean		<input type="checkbox"/>	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	string	Invoice Address Postal Code	<input type="checkbox"/>	Postcode > The postcode.
invoiceContact_attention	string	Invoice Contact Attention	<input type="checkbox"/>	
invoiceContact_businessName	string		<input type="checkbox"/>	
invoiceContact_contactId	int32	Invoice Contact ID	<input type="checkbox"/>	
invoiceContact_email	string	Invoice Contact Email Address	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
invoiceContact_overrideContact	boolean		<input type="checkbox"/>	
invoiceContact_phone1	string	Invoice Contact Phone 1	<input type="checkbox"/>	
invoiceText	string	Invoice Text	<input type="checkbox"/>	The top part > Invoice text > Any user-provided description of the customer ledger document.
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	System generated field for last modification date/time of document.
lineNumber	int32	Line Number	<input type="checkbox"/>	Line no. > A counter of lines in the overview of cash sales document overview .
location_countryId	string	Location Country ID	<input type="checkbox"/>	Location*.
location_id	string	Location ID	<input type="checkbox"/>	Click the magnifier > The identifier
location_name	string	Location Name	<input type="checkbox"/>	Click the magnifier > The displayed name
manualAmount	double	Manual Amount	<input type="checkbox"/>	Manual amount > a check box indicating that the amount has been entered manually.
manualAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Manual amount in your default currency. This field is applicable if the amount is given in another currency than your default.
manualDiscount	boolean		<input type="checkbox"/>	Manual discount > A check box that indicates (if selected) that the discount has been applied manually. If you clear the check box, the system clears entered discount percent, or discount amount, or selected discount code.
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	The name of the attachment.
note_1	string		<input type="checkbox"/>	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the document.
note	string	Note	<input type="checkbox"/>	Table > Icon Notes > Pop-up window for providing any user-defined text connected to the order.
origInvoiceDate	datetime	Original Invoice Date	<input type="checkbox"/>	The top part > Orig invoice date > The date based on which the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences. By default, for a new document, it is the current business date, but you can change the date.

Name	Data Type	Label	Required	Documentation

vatCode_id	string	VAT Code ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	<input type="checkbox"/>	The top part > VAT exempt total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax with the Include in VAT Exempt Total check box selected on the Taxes form. This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

30.1.7 CustomerOverdueChargeLineAttachmentsByOverdueChargeNumber

Get a specific Customer Overdue ChargeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `CustomerOverdueChargeLineAttachmentsByOverdueChargeNumber`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
overdueChargeNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Overdue Charge

Columns of Table Function

The columns of the table function `CustomerOverdueChargeLineAttachmentsByOverdueChargeNumber` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class > The name of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item
account_number	string	Account Number	<input type="checkbox"/>	Number of item

Name	Data Type	Label	Required	Documentation
account_type_1	string		<input type="checkbox"/>	Account > The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.
amount_1	double		<input type="checkbox"/>	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount > The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.

vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

30.1.8 CustomerOverdueChargeLines

Get a range of Customer Overdue Charges - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the

execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
customerRefNumber	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
documentDueDate	datetime	<input type="checkbox"/>		The date when payment for the document is due, in accordance with the credit terms.
documentType	string	<input type="checkbox"/>		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Waarden: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime	string	<input type="checkbox"/>		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition	string	<input type="checkbox"/>		Set time/date as before (<), after (>), before and including (=amp;lt;) OR after and including (=amp;gt;) to filter on time frame.
dunningLevel	int32	<input type="checkbox"/>		The dunning level of the document.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

Name	Data Type	Required	Default Value	Documentation
expandApplications	boolean	<input type="checkbox"/>		True if you want to see all dunning information regarding this document.
expandAttachments	boolean	<input type="checkbox"/>		True if you want to see all attachments regarding this document.
expandDunningInformation	boolean	<input type="checkbox"/>		
expandInvoiceAddress	boolean	<input type="checkbox"/>		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails	boolean	<input type="checkbox"/>		True if you want to see all VAT details regarding this document.
externalReference	string	<input type="checkbox"/>		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	string	<input type="checkbox"/>		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
paymentReference	string	<input type="checkbox"/>		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance with the number series assigned to cash sales in

This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.

Name	Data Type	Label	Required	Documentation
vatTaxableTotal	double	VAT Taxable Total	<input type="checkbox"/>	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	<input type="checkbox"/>	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	<input type="checkbox"/>	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

30.1.9 CustomerOverdueChargeLinesByOverdueChargeNumber

Get a specific Customer Overdue ChargeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeLinesByOverdueChargeNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.

Name	Data Type	Required	Default Value	Documentation
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
overdueChargeNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Overdue Charge

Columns of Table Function

The columns of the table function CustomerOverdueChargeLinesByOverdueChargeNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description_1	string		<input type="checkbox"/>	Name of item/description
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1_1	string		<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class > The identifier of the account class.
account_externalCode2_1	string		<input type="checkbox"/>	Account class > The name of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class > The name of the account class.
account_number_1	string		<input type="checkbox"/>	Number of item
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type_1	string		<input type="checkbox"/>	Account > The account number.
account_type	string	Account Type	<input type="checkbox"/>	Account > The account number.
amount_1	double		<input type="checkbox"/>	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window. If the check box is cleared, then the value appears when the document status is Open.
amount	double	Amount	<input type="checkbox"/>	Amount > The amount after the discount has been applied. The value of this read-only box is calculated automatically by deducting the discount amount from the extended price.

Name	Data Type	Label	Required	Documentation
amountInCurrency_1	double		<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part > Balance > For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_number_1	string		<input type="checkbox"/>	Click the magnifier. > The identifier.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
cashAccount	string	Cash Account	<input type="checkbox"/>	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	<input type="checkbox"/>	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	<input type="checkbox"/>	Mandatory field: The top part > Cash discount date* > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	<input type="checkbox"/>	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	string	Closed Financial Period	<input type="checkbox"/>	Format YYYYMM.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
contact_id	int32	Contact ID	<input type="checkbox"/>	Click the magnifier > The identifier
contact_name	string	Contact Name	<input type="checkbox"/>	Click the magnifier > The displayed name
cost	double	Cost	<input type="checkbox"/>	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	<input type="checkbox"/>	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	string	Credit Terms Description	<input type="checkbox"/>	Click on the magnifier. > The description.
creditTerms_id	string	Credit Terms ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
currencyId	string	Currency ID	<input type="checkbox"/>	The top part > Currency > The currency of the document. By default, it is the customer's default currency, but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.
customer_name	string	Customer Name	<input type="checkbox"/>	Click the magnifier. > The name.
customer_number	string	Customer Number	<input type="checkbox"/>	
customerProject	string		<input type="checkbox"/>	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	string	Custom Reference Number	<input type="checkbox"/>	The top part > External reference > The external reference used in AutoInvoice.
customerVatZone_description	string	VAT Zone Description	<input type="checkbox"/>	Click on the magnifier. > The description.
customerVatZone_id	string	VAT Zone ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
deferralCode	string		<input type="checkbox"/>	The deferral code assigned to the stock item or non-stock item specified in this document line. Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		<input type="checkbox"/>	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It shows the identifier of the deferral schedule associated with the original Cash sale document.

Name	Data Type	Label	Required	Documentation
description	string	Description	<input type="checkbox"/>	Transaction descr. > Any brief comment relevant to the transaction. The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	<input type="checkbox"/>	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	<input type="checkbox"/>	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
discountAmount	double		<input type="checkbox"/>	Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line. The system selects the Manual Discount check box and calculates the line amount after you have entered the discount amount manually and save your changes or added a new line.
discountAmountInCurrency	double		<input type="checkbox"/>	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	string	Discount Code	<input type="checkbox"/>	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	<input type="checkbox"/>	Discount percent > The percent of the line-level discount that has been applied manually or automatically. The system selects the Manual Discount check box and calculates the discount amount after you have entered the percent manually and saved your changes or added a new line.
discountTotal	double	Discount Total	<input type="checkbox"/>	The top part > Discount total > The document discount total.
discountTotalInCurrency	double		<input type="checkbox"/>	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	<input type="checkbox"/>	The top part > Date* > The date when the customer ledger document was created. By default, for a new document, it is the current business date, but you can change the date.

30.1.10 CustomerOverdueCharges: Visma.net Financials Customer Overdue Charges

Get a range of Customer Overdue Charges - ScreenId=AR301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

Label: Customer Overdue Charges

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueCharges. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod	string	<input type="checkbox"/>		The date of the closing of the financial period.

30.1.12 CustomerOverdueChargeTaxDetailsByOverdueChargeNumber

Get a specific Customer Overdue ChargeData for Customer Overdue Charge

Catalog: VismaNet

Schema: CustomerOverdueCharge

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOverdueChargeTaxDetailsByOverdueChargeNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
overdueChargeNumber	string	<input checked="" type="checkbox"/>		Identifies the Customer Overdue Charge

Columns of Table Function

The columns of the table function CustomerOverdueChargeTaxDetailsByOverdueChargeNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	string	Account Description	<input type="checkbox"/>	Name of item/description
account_externalCode1	string	Account External Code 1	<input type="checkbox"/>	Account class & The identifier of the account class.
account_externalCode2	string	Account External Code 2	<input type="checkbox"/>	Account class & The name of the account class.
account_number	string	Account Number	<input type="checkbox"/>	Number of item
account_type	string	Account Type	<input type="checkbox"/>	Account & The account number.
amount	double	Amount	<input type="checkbox"/>	The top part & Amount & The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window. If the check box is cleared, then the value appears when the document status is Open.
amountInCurrency	double	Amount in Currency	<input type="checkbox"/>	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	<input type="checkbox"/>	The top part & Balance & For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.

Name	Data Type	Label	Required	Documentation
balanceInCurrency	double	Balance in Currency	<input type="checkbox"/>	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.

Get a range of Payments. - SceneId=AR302000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: CustomerPayment

Label: Customer Payment Lines

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerPaymentLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		Enter Customer
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Enter the from-value for Ref. no.
invoiceRefNbr	string	<input type="checkbox"/>		Enter Invoice Ref Nbr
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.

31.1.5 CustomerPayments: Visma.net Financials Customer Payments

Get a range of Payments. - SceneId=AR302000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: CustomerPayment

Label: Customer Payments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerPayments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		Enter Customer
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a

Name	Data Type	Required	Default Value	Documentation
				reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Enter the from-value for Ref. no.
invoiceRefNbr	string	<input type="checkbox"/>		Enter Invoice Ref Nbr
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

32.1.4 CustomerPaymentMethodDetailsByCustomerIdCustomerPaymentMethodId: Visma.net Financials Customer Payment Method Details by Customer ID Customer Payment Method ID

Get one specific Customer payment method for one specific customer. ScreenId=AR303010

Catalog: VismaNet

Schema: CustomerPaymentMethod

Label: Customer Payment Method Details by Customer ID Customer Payment Method ID

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerPaymentMethodDetailsByCustomerIdCustomerPaymentMethodId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customerId	string	<input checked="" type="checkbox"/>		Identifies the Customer
customerPaymentMethodId	string	<input checked="" type="checkbox"/>		Identifies the Customer payment method
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.

35.1.2 Departments: Visma.net Financials Departments

Get a range of departments - ScreenId=EP201500

Catalog: VismaNet

Schema: Department

Label: Departments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Departments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.

Name	Data Type	Required	Default Value	Documentation
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

36.1.8 DimensionSegmentValuesById: Visma.net Financials Dimension Segment Values by ID

Get a specific Dimension

Catalog: VismaNet

Schema: Dimension

Label: Dimension Segment Values by ID

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DimensionSegmentValuesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
dimensionId	string	<input checked="" type="checkbox"/>		Identifies the dimension
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandSegmentsValues	boolean	<input type="checkbox"/>		Flag can be used to return data without the segment values.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue	string	<input type="checkbox"/>		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords. ///

37.1.5 DiscountRecordItemPriceClasses: Visma.net Financials Discount Record Item Price Classes

Get a range of discounts - ScreenId=AR209500

Catalog: VismaNet

Schema: Discount

Label: Discount Record Item Price Classes

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DiscountRecordItemPriceClasses. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Schema: Discount

Label: Discounts

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Discounts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

40.1.4 DiscountV2Discounts_Customers

Get a range of discounts - ScreenId=AR209500

Catalog: VismaNet

Schema: DiscountV2

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DiscountV2Discounts_Customers. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

40.1.8 DiscountV2Discounts_Warehouses

Get a range of discounts - ScreenId=AR209500

Catalog: VismaNet

Schema: DiscountV2

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function DiscountV2Discounts_Warehouses. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		System retrieved information for created date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
discountCode	string	<input type="checkbox"/>		
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
lastModifiedDateTime	string	<input type="checkbox"/>		
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
series	string	<input type="checkbox"/>

lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.
linkedToUser	boolean	<input type="checkbox"/>		If the employee is linked to a user.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

Columns of Table Function

The columns of the table function EmployeeEmployees_WorkGroupDescription are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
address_addressLine1	string	Address Line 1	<input type="checkbox"/>	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
address_addressLine2	string	Address Line 2	<input type="checkbox"/>	Address 2 > The second line of the address.
address_addressLine3	string	Address Line 3	<input type="checkbox"/>	Address 3 > The third line of the address.
address_city	string	City	<input type="checkbox"/>	City > The city.
address_country_errorInfo	string		<input type="checkbox"/>	
address_country_id	string	Country ID	<input type="checkbox"/>	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		<input type="checkbox"/>	
address_country_metadata_totalCount	int64		<input type="checkbox"/>	
address_country_name	string	Country Name	<input type="checkbox"/>	Mandatory field: Country name* > The complete name of the country.
address_county_id	string	County ID	<input type="checkbox"/>	Click the magnifier > The identifier
address_county_name	string	County Name	<input type="checkbox"/>	Click the magnifier > The displayed name
address_postalCode	string	Postal Code	<input type="checkbox"/>	Postcode > The postcode.
branch_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branch_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
calendarID	string		<input type="checkbox"/>	
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
contact_attention	string		<input type="checkbox"/>	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	<input type="checkbox"/>	
contact_email	string	Contact Email	<input type="checkbox"/>	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	string		<input type="checkbox"/>	Employee contact > The link to the contact record associated with the employee.
contact_fax	string	Contact Fax	<input type="checkbox"/>	Fax > The fax number.

Name	Data Type	Label	Required	Documentation
contact_firstName	string	Contact First Name	<input type="checkbox"/>	First name > The first name of the employee.
contact_lastName	string	Contact Last Name	<input type="checkbox"/>	Mandatory field: Last name* > The last name of the employee.
contact_midName	string	Contact Middle Name	<input type="checkbox"/>	Middle name > The middle name of the employee.
contact_name	string	Contact Name	<input type="checkbox"/>	Name > The legal name of to appear on the documents.
contact_phone1	string	Contact Phone 1	<input type="checkbox"/>	Phone 1 > The default phone number.
contact_phone2	string	Contact Phone 2	<input type="checkbox"/>	Phone 2 > An additional phone number.
contact_phone3	string	Contact Phone 3	<input type="checkbox"/>	Phone 3 > An additional phone number of the employee.
contact_title	string	Contact Title	<input type="checkbox"/>	Title > The courtesy title to be used for the employee.
contact_w eb	string	Contact Website	<input type="checkbox"/>	Web > The website of the company, if one exists.
department	string	Department	<input type="checkbox"/>	Mandatory field: General information tab > Employee section > Department* > The department the employee works for.
employeeClass_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.
employeeClass_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
employeeId	int32	Employee ID	<input type="checkbox"/>	Mandatory field: The top part > Employee ID* > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEE segmented key.
employeeLogin	string		<input type="checkbox"/>	
employeeName	string	Employee Name	<input type="checkbox"/>	The top part > Employee name > The name of this employee.
employeeNumber	string	Employee Number	<input type="checkbox"/>	General information tab > Employee settings section > Employee ref. no. > A reference number for the employee.
employeeUserId	guid		<input type="checkbox"/>	Employee internal user ID. This is the ID of the user linked to the employee
errorInfo	string	Error Message	<input type="checkbox"/>	
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
status	string	Status	<input type="checkbox"/>	Mandatory field: The top part > Status > The status of the employee. The following options are available: Active, On hold,

Name	Data Type	Label	Required	Documentation
				Hold payments, Inactive, One-time.
TEXT	string		<input type="checkbox"/>	

42.1.4 EmployeeExpenseClaimDetailAttachmentsByEmployeeCode: Visma.net Financials Employee Expense Claim Detail Attachments by Employee Code

Get expense claims for a specific employee

Catalog: VismaNet

Schema: Employee

Label: Employee Expense Claim Detail Attachments by Employee Code

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EmployeeExpenseClaimDetailAttachmentsByEmployeeCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		The customer from the document
date	datetime	<input type="checkbox"/>		The date of the document
departmentId	string	<input type="checkbox"/>		Identifies the department
employeeCd	string	<input checked="" type="checkbox"/>		Identifies the employee
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint

Name	Data Type	Required	Default Value	Documentation
				itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
status	string	<input type="checkbox"/>		The status of the document. (Waarden: Hold, PendingApproval, Approved, Rejected, Released)

Columns of Table Function

The columns of the table function EmployeeExpenseClaimDetailAttachmentsByEmployeeCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amountInClaimCurr	double		<input type="checkbox"/>	Amount in claim currency > The amount claimed by the employee, which is expressed in the currency of the expense claim.
approvalDate	datetime	Approval Date	<input type="checkbox"/>	The top part > Approval date > The date when the claim was approved.
approvalStatus_1	string		<input type="checkbox"/>	The top part > Approval status > The status of the claim in Approval.
approvalStatus	string	Approval Status	<input type="checkbox"/>	Approval status > The approval status, which indicates whether the detail row requires approval and, if it does, what the current state of approval is.
approvalStatusText_1	string		<input type="checkbox"/>	The top part > Approval status > A text field.
approvalStatusText	string	Approval Status Text	<input type="checkbox"/>	Last approval comment > The approval status text suitable for display
approver	string	Approver	<input type="checkbox"/>	Pending approver > The identifier of the person authorized to approve the activity, if approval is required. This is either the approver of the project task or, if no approver is assigned to the project task, the project manager.
arReferenceNbr	string		<input type="checkbox"/>	REef.no. customer > The reference number of the customer ledger document.
branch_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branch_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
claimAmount	double	Claim Amount	<input type="checkbox"/>	Claim amount > The amount claimed by the employee, which is calculated as the total claim amount minus the employee part.
claimDetailId	int32	Claim Detail ID	<input type="checkbox"/>	Identifies the expense claim detail id, necessary when updating detail information
claimedBy_internalId	string	Claimed by - Internal ID	<input type="checkbox"/>	
claimedBy_name	string	Claimed by - Name	<input type="checkbox"/>	The name of the particular destination of the selected type.
claimedBy_number	string	Claimed by - Number	<input type="checkbox"/>	The identifier of the particular destination of the selected type.
claimTotal	double	Claim Total	<input type="checkbox"/>	The top part > Claim total > The total amount of the claim.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
currency_1	string		<input type="checkbox"/>	The top part & Currency & The currency of the claim.
currency	string	Currency	<input type="checkbox"/>	Currency & The currency of the expense receipt. How ever, if you enter a claim line directly, the currency value is read-only and matching the claim currency.
customer_name_1	string		<input type="checkbox"/>	Click the magnifier. & The name.
customer_name	string	Customer Name	<input type="checkbox"/>	Click the magnifier. & The name.
customer_number_1	string		<input type="checkbox"/>	
customer_number	string	Customer Number	<input type="checkbox"/>	
date_1	datetime		<input type="checkbox"/>	Mandatory field: The top part & Date* & The date w hen the claim w as entered.
date	datetime	Date	<input type="checkbox"/>	Mandatory field: Date & The date w hen the expense w as incurred.
department_description	string	Department Description	<input type="checkbox"/>	Click on the magnifier. & The description.
department_id	string	Department ID	<input type="checkbox"/>	Click on the magnifier. & The identifier.
description_1	string		<input type="checkbox"/>	Mandatory field: The top part & Description & A description of the claim.
description	string	Description	<input type="checkbox"/>	Mandatory field: Description* & A description of the transaction.
employeePart	double		<input type="checkbox"/>	Employee part & The part of the total amount that w ill not be paid back to the employee. The percentage depends on the company policy.
errorInfo	string	Error Message	<input type="checkbox"/>	
expenseAccount_description	string	Expense Account Description	<input type="checkbox"/>	Name of item/description
expenseAccount_externalCode1	string		<input type="checkbox"/>	Account class & The identifier of the account class.
expenseAccount_externalCode2	string		<input type="checkbox"/>	Account class & The name of the account class.
expenseAccount_number	string	Expense Account Number	<input type="checkbox"/>	Number of item
expenseAccount_type	string	Expense Account Type	<input type="checkbox"/>	Account & The account number.
expenseItem_description	string		<input type="checkbox"/>	Name of item/description
expenseItem_number	string		<input type="checkbox"/>	Number of item
expenseSubaccount_description	string		<input type="checkbox"/>	Click on the magnifier. & The description.

Name	Data Type	Label	Required	Documentation
expenseSubaccount_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
id	guid	ID	<input type="checkbox"/>	The ID of the attachment
invoiceable	boolean	Invoiceable	<input type="checkbox"/>	Invoiceable > A check box that, if selected, indicates that the claim amount is invoiceable to the customer (the total amount minus the employee's part).
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	System generated information: The latest time the expense claim was modified
lineId	guid		<input type="checkbox"/>	The expense claim line id
location_description_1	string		<input type="checkbox"/>	Click on the magnifier. > The description.
location_description	string	Location Description	<input type="checkbox"/>	Click on the magnifier. > The description.
location_id_1	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
location_id	string	Location ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.

42.1.6 EmployeeExpenseClaimsByEmployeeCode: Visma.net Financials Employee Expense Claims by Employee Code

Get expense claims for a specific employee

Catalog: VismaNet

Schema: Employee

Label: Employee Expense Claims by Employee Code

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `EmployeeExpenseClaimsByEmployeeCode`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		The customer from the document
date	datetime	<input type="checkbox"/>		The date of the document
departmentId	string	<input type="checkbox"/>		Identifies the department
employeeCd	string	<input checked="" type="checkbox"/>		Identifies the employee
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.

44.1.2 ExpenseClaimDetails: Visma.net Financials Expense Claim Details

Get a range of Expense Claims, a filter needs to be specified. ScreenId=EP301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2021-October:Added forced pagination

Catalog: VismaNet

Schema: ExpenseClaim

Label: Expense Claim Details

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ExpenseClaimDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		The customer from the document
date	datetime	<input type="checkbox"/>		The date of the document
departmentId	string	<input type="checkbox"/>		Identifies the department
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime	string	<input type="checkbox"/>		System-generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max

Name	Data Type	Required	Default Value	Documentation
				page size, request will be limited to max page size.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pagenumber and pagesize for pagination purposes. Pagenumber and pagesize does not work with NumberToRead and SkipRecords.
status	string	<input type="checkbox"/>		The status of the document. (Waarden: Hold, PendingApproval, Approved, Rejected, Released)

44.1.5 ExpenseClaimExpenseClaimByexpenseClaimNbr_DetailsAttachments

Get a specific Expense Claim

Catalog: VismaNet

Schema: ExpenseClaim

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ExpenseClaimExpenseClaimByexpenseClaimNbr_DetailsAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

45.1.2 ExpenseReceipts: Visma.net Financials Expense Receipts

Get a range of Expense Receipts, a filter needs to be specified. ScreenId=EP301020

Catalog: VismaNet

Schema: ExpenseReceipt

Label: Expense Receipts

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ExpenseReceipts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
claimedBy	string	<input type="checkbox"/>		Identifies the employee from the document
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
customer	string	<input type="checkbox"/>		Identifies the customer from the document
date	string	<input type="checkbox"/>		The date of the document
dateCondition	string	<input type="checkbox"/>		
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When

Name	Data Type	Required	Default Value	Documentation
				the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventory	string	<input type="checkbox"/>		Identifies the inventory item from the document
invoiceable	boolean	<input type="checkbox"/>		If the document is invoiceable
project	string	<input type="checkbox"/>		Identifies the project from the document
projectTask	string	<input type="checkbox"/>		Filter on Task ID.
status	string	<input type="checkbox"/>		The status of the document. (Waarden: Open, Pending, Approved, Rejected, Released)

47.1.2 FixedAssetByFixedAssetID

Get a specific Fixed Asset - Screen ID:FA303000

Catalog: VismaNet

Schema: FixedAsset

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function FixedAssetByFixedAssetID. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
ExpandAccounts	boolean	<input type="checkbox"/>		Set to True to include accounts and subaccounts. Default value is False
FixedAssetID	string	<input checked="" type="checkbox"/>		Identifies the fixed asset

Columns of Table Function

The columns of the table function FixedAssetByFixedAssetID are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accounts_accountID	string		<input type="checkbox"/>	The fixed asset account for this fixed asset
accounts_accrualAccountID	string		<input type="checkbox"/>	The accrual account for this fixed asset
accounts_accrualSubAccountID	string		<input type="checkbox"/>	The accrual sub account for this fixed asset

Name	Data Type	Label	Required	Documentation
accounts_accumulatedDepreciationAccountID	string		<input type="checkbox"/>	The accumulated depreciation account for this fixed asset
accounts_accumulatedDepreciationSubAccountID	string		<input type="checkbox"/>	The accumulated depreciation sub for this fixed asset
accounts_creditAccountID	string		<input type="checkbox"/>	The credit account
accounts_creditSubAccountID	string		<input type="checkbox"/>	The credit sub account
accounts_debitAccountID	string		<input type="checkbox"/>	The debit account
accounts_debitSubAccountID	string		<input type="checkbox"/>	The debit sub account
accounts_depreciatedExpenseAccountID	string		<input type="checkbox"/>	The depreciation expense account for this fixed asset
accounts_depreciatedExpenseSubAccountID	string		<input type="checkbox"/>	The depreciation expense sub for this fixed asset
accounts_disposalAccountID	string		<input type="checkbox"/>	The proceeds account for this fixed asset
accounts_disposalSubAccountID	string		<input type="checkbox"/>	The proceeds sub for this fixed asset
accounts_gainAccountID	string		<input type="checkbox"/>	The gain account for this fixed asset
accounts_gainSubAccountID	string		<input type="checkbox"/>	The gain sub for this fixed asset
accounts_lossAccountID	string		<input type="checkbox"/>	The loss account for this fixed asset
accounts_lossSubAccountID	string		<input type="checkbox"/>	The loss sub for this fixed asset
accounts_subAccountID	string		<input type="checkbox"/>	The sub account for this fixed asset
assetID	string		<input type="checkbox"/>	The id that identifies this fixed asset
bookBalance_acquisitionCost	double		<input type="checkbox"/>	The acquisition cost of this fixed asset
bookBalance_book_bookID	string		<input type="checkbox"/>	The book id of this fixed asset
bookBalance_book_description	string		<input type="checkbox"/>	The description of the book
bookBalance_depreciationFromDate	datetime		<input type="checkbox"/>	The date this asset is placed in service
bookBalance_depreciationFromPeriod	string		<input type="checkbox"/>	The first period this fixed asset will start/has started depreciating
bookBalance_depreciationMethodID	string		<input type="checkbox"/>	The depreciation method id of this fixed asset
bookBalance_depreciationToPeriod	string		<input type="checkbox"/>	The last period this fixed asset will depreciate/ was depreciated
bookBalance_lastDepreciationPeriod	string		<input type="checkbox"/>	The last period this asset has been depreciated
bookBalance_salvageAmount	double		<input type="checkbox"/>	The salvage amount of this fixed asset
bookBalance_usefulLife	double		<input type="checkbox"/>	The useful life of this fixed asset in years
classID	string		<input type="checkbox"/>	The class id of this fixed asset
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.

Name	Data Type	Label	Required	Documentation

49.1.3 FixedAssetPropertyTaxGroupByPropertyTaxID

Get a specific Fixed Asset Property Tax Group - Screen ID: FA209000

Catalog: VismaNet

Schema: FixedAssetPropertyTaxGroup

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function FixedAssetPropertyTaxGroupByPropertyTaxID. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
PropertyTaxID	string	<input checked="" type="checkbox"/>

currDebitAmount	double		<input type="checkbox"/>	Debit amount (currency) & The debit amount in the selected currency for the specified account over the selected period.
currency	string	Currency	<input type="checkbox"/>	Click the Show currency details check box to view the below fields in the window .Currency & The currency of transactions in the account. If it is not specified, the balance is in the base currency.
currEndingBalance	double		<input type="checkbox"/>	Ending balance (currency) & The account balance in the selected currency at the start of the selected period.
debitAmount	double	Debit Amount	<input type="checkbox"/>	Debit amount & The transaction debit amount charged to the account during the selected financial period.
description	string	Description	<input type="checkbox"/>	Description & The user-defined description of the transaction.
endingBalance	double	End Balance	<input type="checkbox"/>	Ending balance & The running total of the account's ending balance calculated in the order of transactions displayed in the table.
errorInfo	string	Error Message	<input type="checkbox"/>	
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	System generated information reflecting when the last change was done.
ledger_description	string	Ledger Description	<input type="checkbox"/>	Click on the magnifier. & The description.
ledger_id	string	Ledger ID	<input type="checkbox"/>	Click on the magnifier. & The identifier.
lineNumber	int32	Line Number	<input type="checkbox"/>	
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
module	string	Module	<input type="checkbox"/>	Workspace & The workspace where the transaction originated.
period	string	Period	<input type="checkbox"/>	Period & The financial period of the transaction.
refNumber	string	Reference Number	<input type="checkbox"/>	Ref. number & The reference number of the external document on which this transaction is based.
subaccount	string	Sub Account	<input type="checkbox"/>	Subaccount & The subaccount used in the batch.
tranDate	datetime	Transaction Date	<input type="checkbox"/>	Trans date & The date of the transaction.

53 Schema: Inventory

53.1 Tables

53.1.1 InventoryAttachments: Visma.net Financials Inventory Attachments

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Attachments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invtative SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics	boolean	<input type="checkbox"/>		This filter can be used only for stock items, from the Price/cost information tab.
alternateID	string	<input type="checkbox"/>		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition for attachment.
attributes	string	<input type="checkbox"/>		Attributes (additional information) connected to the entity. Examples: <pre> {{base}}/inventory? attributes={"AttributeID":"ValueID", "AttributeID":"ValueID"} {{base}}/inventory? attributes={"AttributeID":"ValueID1, ValueID2"} </pre>

Name	Data Type	Required	Default Value	Documentation
availabilityLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information.
availabilityLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
description	string	<input type="checkbox"/>		A brief description of the stock item from the Top part of the window .
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandAccountInformation	boolean	<input type="checkbox"/>		Set to true to retrieve information about the account information connected to the item.
expandAttachment	boolean	<input type="checkbox"/>		Set to true to retrieve information about the attachments connected to the item.
expandAttribute	boolean	<input type="checkbox"/>		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference	boolean	<input type="checkbox"/>		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits	boolean	<input type="checkbox"/>		Set to true to retrieve information about the units of measure connected to the item.
expandNote	boolean	<input type="checkbox"/>		Set to true to retrieve the note value connected to the item.
expandSalesCategories	boolean	<input type="checkbox"/>		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails	boolean	<input type="checkbox"/>		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail	boolean	<input type="checkbox"/>		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.

Name	Data Type	Required	Default Value	Documentation
inventoryNumber	string	<input type="checkbox"/>		The Item ID.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size. MaxPageSize will be set to 5000 from 1. April 2022
salesCategory	int32	<input type="checkbox"/>		The Category ID for the sales category, found on the Attributes tab.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

Columns of Table Function

The columns of the table function InventoryAttachments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountInformation_cogsAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_cogsAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_cogsAccount_type	string		<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
accountInformation_cogsSubaccount_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.
accountInformation_cogsSubaccount_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
accountInformation_expenseAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_expenseAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_expenseAccount_type	string		<input type="checkbox"/>	
accountInformation_expenseAccrualAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_expenseAccrualAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_expenseAccrualAccount_type	string		<input type="checkbox"/>	
accountInformation_expenseEuAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_expenseEuAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_expenseEuAccount_type	string		<input type="checkbox"/>	
accountInformation_expenseImportAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_expenseImportAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_expenseImportAccount_type	string		<input type="checkbox"/>	
accountInformation_expenseNonTaxableAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_expenseNonTaxableAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_expenseNonTaxableAccount_type	string		<input type="checkbox"/>	
accountInformation_expenseSubaccount_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.
accountInformation_expenseSubaccount_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
accountInformation_inventoryAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_inventoryAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_inventoryAccount_type	string		<input type="checkbox"/>	
accountInformation_salesAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_salesAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_salesAccount_type	string		<input type="checkbox"/>	

Name	Data Type	Label	Required	Documentation
accountInformation_salesEuAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_salesEuAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_salesEuAccount_type	string		<input type="checkbox"/>	
accountInformation_salesExportAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_salesExportAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_salesExportAccount_type	string		<input type="checkbox"/>	
accountInformation_salesNonTaxableAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_salesNonTaxableAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_salesNonTaxableAccount_type	string		<input type="checkbox"/>

note	string	Note	<input type="checkbox"/>	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the inventory item.
packaging_baseItemVolume	double		<input type="checkbox"/>	The volume of the <see cref="!:BaseUnit">Base Unit</see> of the item.
packaging_baseItemWeight	double		<input type="checkbox"/>	The weight of the <see cref="!:BaseUnit">Base Unit</see> of the item.
packaging_volumeUOM	string		<input type="checkbox"/>	The <see cref="!:INUnit">Unit of Measure</see> used for the <see cref="P:Visma.net.ERP.Web.Api.Model.V1.IN.PackagingDto.BaseItemVolume">Volume</see> of the item.
packaging_weightUOM	string		<input type="checkbox"/>	The <see cref="!:INUnit">Unit of Measure</see> used for the <see cref="P:Visma.net.ERP.Web.Api.Model.V1.IN.PackagingDto.BaseItemWeight">Weight</see> of the item.
pendingCost	double	Pending Cost	<input type="checkbox"/>	Price/cost information tab > Standard cost section > Pending cost > The pending standard cost for the stock item.
pendingCostDate	datetime	Pending Cost Date	<input type="checkbox"/>	Price/cost information tab > Standard cost section > Pending cost date > The date when the pending standard cost becomes effective.
postingClass_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.
postingClass_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.

Name	Data Type	Label	Required	Documentation
priceClass_description	string	Price Class Description	<input type="checkbox"/>	Click on the magnifier. > The description.
priceClass_id	string	Price Class ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.
priceClassID	string		<input type="checkbox"/>	The Price/cost information tab > Price management section > Price class > The price class of the item.
priceManager_id	string		<input type="checkbox"/>	
priceManager_name	string		<input type="checkbox"/>	
priceManagerID	guid		<input type="checkbox"/>	The Price/cost information tab > Price management section > Price manager > The ID of the manager responsible for the product pricing.
priceWorkgroupID	int32		<input type="checkbox"/>	The Price/cost information tab > Price management section > Price work group > The work group responsible for product pricing. Select the pricing work group for the stock item.
purchaseUnit	string		<input type="checkbox"/>	Mandatory field: General information tab > Unit of measurement section > Purchase unit * > The UoM to be used as the purchase unit for the stock item.
recommendedPrice	double		<input type="checkbox"/>	The Price/cost information tab > Price management section > List price > The manufacturer's suggested retail price (MSRP) of the stock item.
revision	int32	Revision	<input type="checkbox"/>	The version of the attachment.
salesUnit	string	Sales Unit	<input type="checkbox"/>	Mandatory field: General information tab > Unit of measurement section > Sales unit * > The UoM to be used as the sales unit for the stock item.
status	string	Status	<input type="checkbox"/>	The top part > Item status > The status of the stock item. The alternatives are: Active, No sales, No purchases, No request, Inactive, Marked for deletion.
stockItem	boolean	Stock Item	<input type="checkbox"/>	
type	string	Type	<input type="checkbox"/>	General information tab > Item defaults section > Type > The type of stock item.
vatCode_description	string	VAT Code Description	<input type="checkbox"/>	Click on the magnifier. > The description.
vatCode_id	string	VAT Code ID	<input type="checkbox"/>	Click on the magnifier. > The identifier.

53.1.2 InventoryAttachmentsByInventoryNumber: Visma.net Financials Inventory Attachments by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Attachments by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttachmentsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory item

53.1.3 InventoryAttributes: Visma.net Financials Inventory Attributes

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Attributes

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttributes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics	boolean	<input type="checkbox"/>		This filter can be used only for stock items, from the Price/cost information tab.
alternateID	string	<input type="checkbox"/>		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information for last modified date and time for attachment.

Name	Data Type	Required	Default Value	Documentation
attachmentLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition for attachment.
attributes	string	<input type="checkbox"/>		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory? attributes={"AttributeID":"ValueID", "AttributeID":"ValueID"} {{base}}/inventory? attributes={"AttributeID":"ValueID1, ValueID2"}
availabilityLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information.
availabilityLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
description	string	<input type="checkbox"/>		A brief description of the stock item from the Top part of the window .
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandAccountInformation	boolean	<input type="checkbox"/>		Set to true to retrieve information about the account information connected to the item.
expandAttachment	boolean	<input type="checkbox"/>		Set to true to retrieve information about the attachments connected to the item.
expandAttribute	boolean	<input type="checkbox"/>		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference	boolean	<input type="checkbox"/>		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits	boolean	<input type="checkbox"/>		Set to true to retrieve information about the units of measure connected to the item.
expandNote	boolean	<input type="checkbox"/>		Set to true to retrieve the note value connected to the item.
expandSalesCategories	boolean	<input type="checkbox"/>		Set to true to retrieve details about the sales categories

Name	Data Type	Required	Default Value	Documentation
				connected to the item.
expandSupplierDetails	boolean	<input type="checkbox"/>		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail	boolean	<input type="checkbox"/>		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
inventoryNumber	string	<input type="checkbox"/>		The Item ID.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size. MaxPageSize will be set to 5000 from 1. April 2022
salesCategory	int32	<input type="checkbox"/>		The Category ID for the sales category, found on the Attributes tab.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

53.1.5 InventoryByinventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByinventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryId	int32	<input checked="" type="checkbox"/>		Identifies the Inventory item

53.1.7 InventoryByinventoryId_Attributes

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByinventoryId_Attributes. A value must be provided at all times for required

parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryId	int32	<input checked="" type="checkbox"/>		Identifies the Inventory item

Columns of Table Function

The columns of the table function `InventoryByinventoryId_Attributes` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountInformation_cogsAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_cogsAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_cogsAccount_type	string		<input type="checkbox"/>	
accountInformation_cogsSubaccount_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.

53.1.8 InventoryByinventoryId_CrossReferences

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByinventoryId_CrossReferences. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

53.1.10 InventoryByinventoryId_SalesCategories

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByinventoryId_SalesCategories. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryId	int32	<input checked="" type="checkbox"/>		Identifies the Inventory item

53.1.12 InventoryByinventoryId_WarehouseDetails

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByinventoryId_WarehouseDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.

Name	Data Type	Required	Default Value	Documentation
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryId	int32	<input checked="" type="checkbox"/>		Identifies the Inventory item

53.1.14 InventoryCrossReferences: Visma.net Financials Inventory Cross-references

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Cross-references

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferences. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics	boolean	<input type="checkbox"/>		This filter can be used only for stock items, from the Price/cost information tab.
alternateID	string	<input type="checkbox"/>		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition for attachment.
attributes	string	<input type="checkbox"/>		Attributes (additional information) connected to the entity. Examples: <code>{{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"}</code> <code>{{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}</code>
availabilityLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information.
availabilityLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
description	string	<input type="checkbox"/>		A brief description of the stock item from the Top part of the window .
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the

Name	Data Type	Required	Default Value	Documentation
				specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandAccountInformation	boolean	<input type="checkbox"/>		Set to true to retrieve information about the account information connected to the item.
expandAttachment	boolean	<input type="checkbox"/>		Set to true to retrieve information about the attachments connected to the item.
expandAttribute	boolean	<input type="checkbox"/>		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference	boolean	<input type="checkbox"/>		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits	boolean	<input type="checkbox"/>		Set to true to retrieve information about the units of measure connected to the item.
expandNote	boolean	<input type="checkbox"/>		Set to true to retrieve the note value connected to the item.
expandSalesCategories	boolean	<input type="checkbox"/>		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails	boolean	<input type="checkbox"/>		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail	boolean	<input type="checkbox"/>		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
inventoryNumber	string	<input type="checkbox"/>		The Item ID.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

Name	Data Type	Required	Default Value	Documentation
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size. MaxPageSize will be set to 5000 from 1. April 2022
salesCategory	int32	<input type="checkbox"/>		The Category ID for the sales category, found on the Attributes tab.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

53.1.15 InventoryCrossReferencesByInventoryNumber: Visma.net Financials Inventory Cross-references by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Cross-references by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferencesByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory item

53.1.16 InventoryCrossReferencesByInventoryNumber1: Visma.net Financials Inventory Cross-references by Inventory Number

Get a range of cross-reference for a specific inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Cross-references by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferencesByInventoryNumber1. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `InventoryCrossReferencesByInventoryNumber1` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	string	Alternate ID	<input type="checkbox"/>	Mandatory field: Alternate ID > The alternate ID of the stock item (under the specified item ID) as used by the supplier or customer.
alternateType	string	Alternate Type	<input type="checkbox"/>	Alternate type > The type of alternate codification used for the item if applicable.
bAccount_internalId	int32		<input type="checkbox"/>	
bAccount_name	string		<input type="checkbox"/>	The name of the particular destination of the selected type.
bAccount_number	string		<input type="checkbox"/>	The identifier of the particular destination of the selected type.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.

53.1.22 InventoryPOReceiptTakeBarCodesByReceiptNumber: Visma.net Financials Inventory PO Receipt Take Barcodes by Receipt Number

Get a range of barcodes for a specific purchase receipt

Catalog: VismaNet

Schema: Inventory

Label: Inventory PO Receipt Take Barcodes by Receipt Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryPOReceiptTakeBarCodesByReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.

Name	Data Type	Required	Default Value	Documentation
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
receiptNbr	string	<input checked="" type="checkbox"/>		

Columns of Table Function

53.1.25 InventorySalesOrderBarCodesByOrderNumber: Visma.net Financials Inventory Sales Order Barcodes by Order Number

Get a range of barcodes for a specific sales order

Catalog: VismaNet

Schema: Inventory

Label: Inventory Sales Order Barcodes by Order Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySalesOrderBarCodesByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
orderNbr	string	<input checked="" type="checkbox"/>		

Columns of Table Function

The columns of the table function `InventorySalesOrderBarCodesByOrderNumber` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

53.1.32 InventorySupplierDetailsByInventoryNumber: Visma.net Financials Inventory Supplier Details by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Supplier Details by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySupplierDetailsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory item

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnits. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics	boolean	<input type="checkbox"/>		This filter can be used only for stock items, from the Price/cost information tab.
alternateID	string	<input type="checkbox"/>		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition for attachment.
attributes	string	<input type="checkbox"/>		Attributes (additional information) connected to the entity. Examples: <pre> {{base}}/inventory? attributes={"AttributeID":"ValueID", "AttributeID":"ValueID"} {{base}}/inventory? attributes={"AttributeID":"ValueID1, ValueID2"} </pre>
availabilityLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information.
availabilityLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
description	string	<input type="checkbox"/>		A brief description of the stock item from the Top part of the window .
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandAccountInformation	boolean	<input type="checkbox"/>		Set to true to retrieve information about the account information connected to the item.
expandAttachment	boolean	<input type="checkbox"/>		Set to true to retrieve information about the attachments connected to the item.

Name	Data Type	Required	Default Value	Documentation
expandAttribute	boolean	<input type="checkbox"/>		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference	boolean	<input type="checkbox"/>		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item).
expandInventoryUnits	boolean	<input type="checkbox"/>		Set to true to retrieve information about the units of measure connected to the item.
expandNote	boolean	<input type="checkbox"/>		Set to true to retrieve the note value connected to the item.
expandSalesCategories	boolean	<input type="checkbox"/>		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails	boolean	<input type="checkbox"/>		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail	boolean	<input type="checkbox"/>		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
inventoryNumber	string	<input type="checkbox"/>		The Item ID.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size. MaxPageSize

Name	Data Type	Required	Default Value	Documentation
				will be set to 5000 from 1. April 2022
salesCategory	int32	<input type="checkbox"/>		The Category ID for the sales category, found on the Attributes tab.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pagenumber and pagesize for pagination purposes. Pagenumber and pagesize does not work with NumberToRead and SkipRecords.

Columns of Table Function

The columns of the table function InventoryUnits are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountInformation_cogsAccount_description	string		<input type="checkbox"/>	Name of item/description
accountInformation_cogsAccount_number	string		<input type="checkbox"/>	Number of item
accountInformation_cogsAccount_type	string		<input type="checkbox"/>	
accountInformation_cogsSubaccount_description	string		<input type="checkbox"/>	Click on the magnifier. > The description.
accountInformation_cogsSubaccount_id	string		<input type="checkbox"/>	Click on the magnifier. > The identifier.
accountInformation_expenseAccount_description	string		<input type="checkbox"/>	Name of item/description

53.1.34 InventoryUnitsByInventoryNumber: Visma.net Financials Inventory Units by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Units by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory item

Columns of Table Function

The columns of the table function InventoryUnitsByInventoryNumber are shown below. Each column has an SQL data type.

53.1.35 InventoryWarehouseDetails: Visma.net Financials Inventory Warehouse Details

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Warehouse Details

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryWarehouseDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics	boolean	<input type="checkbox"/>		This filter can be used only for stock items, from the Price/cost information tab.
alternateID	string	<input type="checkbox"/>		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition for attachment.
attributes	string	<input type="checkbox"/>		Attributes (additional information) connected to the entity. Examples: <pre> {{base}}/inventory? attributes={"AttributeID":"ValueID", "AttributeID":"ValueID"} {{base}}/inventory? attributes={"AttributeID":"ValueID1, ValueID2"} </pre>
availabilityLastModifiedDateTime	string	<input type="checkbox"/>		System retrieved information.
availabilityLastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
createdDateTime	string	<input type="checkbox"/>		Creation date and time.
createdDateTimeCondition	string	<input type="checkbox"/>		System-retrieved information for state/condition
description	string	<input type="checkbox"/>		A brief description of the stock item from the Top part of the window .
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
expandAccountInformation	boolean	<input type="checkbox"/>		Set to true to retrieve information about the account information connected to the item.

Name	Data Type	Required	Default Value	Documentation
expandAttachment	boolean	<input type="checkbox"/>		Set to true to retrieve information about the attachments connected to the item.
expandAttribute	boolean	<input type="checkbox"/>		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference	boolean	<input type="checkbox"/>		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits	boolean	<input type="checkbox"/>		Set to true to retrieve information about the units of measure connected to the item.
expandNote	boolean	<input type="checkbox"/>		Set to true to retrieve the note value connected to the item.
expandSalesCategories	boolean	<input type="checkbox"/>		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails	boolean	<input type="checkbox"/>		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail	boolean	<input type="checkbox"/>		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue	string	<input type="checkbox"/>		Greater than value. The item which is the object for this, varies from API to API.
inventoryNumber	string	<input type="checkbox"/>		The Item ID.
lastModifiedDateTime	string	<input type="checkbox"/>		System generated value for last modification of transaction/record. Use format: YYYY-MM-DD HH:MM (date and time) to filter from date to present.
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		System retrieved information for state/condition.
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max

Name	Data Type	Required	Default Value	Documentation
				page size, request will be limited to max page size. MaxPageSize will be set to 5000 from 1. April 2022
salesCategory	int32	<input type="checkbox"/>		The Category ID for the sales category, found on the Attributes tab.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.

Columns of Table Function

53.1.36 InventoryWarehouseDetailsByInventoryNumber: Visma.net Financials Inventory Warehouse Details by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Warehouse Details by Inventory Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `InventoryWarehouseDetailsByInventoryNumber`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory item

Catalog: VismaNet

Schema: InventoryAdjustment

Label: Inventory Adjustment Attachments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAdjustmentAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

54.1.6 InventoryAdjustmentLines: Visma.net Financials Inventory Adjustment Lines

Get a range of Inventory Adjustment Dto - ScreenId=IN303000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: InventoryAdjustment

Label: Inventory Adjustment Lines

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAdjustmentLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

controlAmount	double		<input type="checkbox"/>	The top part > Control amount > The manually entered summary amount for all specified inventory items. Control Amount is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. If the Control Amount and Total Amount values do not match, the system generates a warning message and the issue cannot be saved.
controlQuantity	double	Control Quantity	<input type="checkbox"/>	The manually entered quantity of inventory items. Control Qty. is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. If the Control Qty. and Total Qty. values do not match, the system generates a warning message and the issue cannot be saved.

Name	Data Type	Label	Required	Documentation
date	datetime	Date	<input type="checkbox"/>	The date when the receipt was created. All transactions included in this document will have this transaction date.
description	string	Description	<input type="checkbox"/>	A brief description of the inventory issue or its transactions.
errorInfo	string	Error Message	<input type="checkbox"/>	
externalReference	string	External Reference	<input type="checkbox"/>	The external reference number of the inventory issue document (for example, the vendor's reference code).
hold	boolean	Hold	<input type="checkbox"/>	A check box that you select to give the receipt the On Hold status. Clear the check box to save the receipt with the Balanced status.
id	guid	ID	<input type="checkbox"/>	The ID of the attachment
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	The date when the document was last modified.
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
name	string	Name	<input type="checkbox"/>	The name of the attachment.
postPeriod	string	Post Period	<input type="checkbox"/>	The financial period to which the transactions recorded in the document should be posted. Format MMYYYY.
referenceNumber	string	Reference Number	<input type="checkbox"/>	The unique reference number of the receipt, which the system automatically assigns according to the numbering sequence selected for receipts on the Inventory Preferences (IN.10.10.00) form.
revision	int32	Revision	<input type="checkbox"/>	The version of the attachment.
status	string	Status	<input type="checkbox"/>	The current status of the receipt. The following options are available: On Hold: The receipt/issue is a draft and can be edited. Receipts with this status cannot be released. Balanced: The receipt/issue data has been validated by the system and the receipt can be released. It also can be modified or deleted, but changes can be saved only if the receipt is balanced. Released: The receipt/issue has been released and cannot be edited or deleted.
totalAmount	double	Total Amount	<input type="checkbox"/>	The top part & Total amount & The total amount, calculated as a sum of amounts for all inventory issue operations included in this issue document.

Name	Data Type	Label	Required	Documentation
totalQuantity	double	Total Quantity	<input type="checkbox"/>	The total quantity of inventory items, which the system calculates automatically, for the document.

55.1.2 InventoryIssueAttachmentsByInventoryIssueNumber: Visma.net Financials Inventory Issue Attachments by Inventory Issue Number

Get a specific Inventory Issue document

Catalog: VismaNet

Schema: InventoryIssue

Label: Inventory Issue Attachments by Inventory Issue Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryIssueAttachmentsByInventoryIssueNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. 55.1.6 InventoryIssueLineAttachments: Visma.net Financials Inventory Issue Line Attachments

Get a range of Inventory items - ScreenId=IN302000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: InventoryIssue

Label: Inventory Issue Line Attachments

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `InventoryIssueLineAttachments`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		
lastModifiedDateTime	string	<input type="checkbox"/>		
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use <code>pageNumber</code> and <code>pageSize</code> for pagination purposes. <code>pageNumber</code> and <code>pageSize</code> does not work with <code>NumberToRead</code> and <code>SkipRecords</code> .
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The <code>OrderBy</code> parameter has no effect on the result.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. 55.1.9 InventoryIssueLinesByInventoryIssueNumber: Visma.net Financials Inventory Issue Lines by Inventory Issue Number

Get a specific Inventory Issue document

Catalog: VismaNet

Schema: InventoryIssue

Label: Inventory Issue Lines by Inventory Issue Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryIssueLinesByInventoryIssueNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryIssueNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory Issue document

Columns of Table Function

The columns of the table function InventoryIssueLinesByInventoryIssueNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
batchNumber	string	Batch Number	<input type="checkbox"/>	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.

Name	Data Type	Label	Required	Documentation
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. > The name.

56.1.3 InventoryReceiptAttachmentsByInventoryReceiptNumber: Visma.net Financials Inventory Receipt Attachments by Inventory Receipt Number

Get a specific Inventory Receipt document

Catalog: VismaNet

Schema: InventoryReceipt

Label: Inventory Receipt Attachments by Inventory Receipt Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryReceiptAttachmentsByInventoryReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryReceiptNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory Issue document

Columns of Table Function

The columns of the table function `InventoryReceiptAttachmentsByInventoryReceiptNumber` are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
batchNumber	string	Batch Number	<input type="checkbox"/>	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.

56.1.7 InventoryReceiptLineAttachmentsByInventoryReceiptNumber: Visma.net Financials Inventory Receipt Line Attachments by Inventory Receipt Number

Get a specific Inventory Receipt document

Catalog: VismaNet

Schema: InventoryReceipt

Label: Inventory Receipt Line Attachments by Inventory Receipt Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryReceiptLineAttachmentsByInventoryReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
inventoryReceiptNumber	string	<input checked="" type="checkbox"/>		Identifies the Inventory Issue document

Columns of Table Function

The columns of the table function InventoryReceiptLineAttachmentsByInventoryReceiptNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
batchNumber	string	Batch Number	<input type="checkbox"/>	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.
branchNumber_name_1	string		<input type="checkbox"/>	Click the magnifier. > The name.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.

Name	Data Type	Label	Required	Documentation
batchNumber	string	Batch Number	<input type="checkbox"/>	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.
branchNumber_name	string	Branch Name	<input type="checkbox"/>	Click the magnifier. > The name.

Name	Data Type	Label	Required	Documentation
branchNumber_number	string	Branch Number	<input type="checkbox"/>	Click the magnifier. > The identifier.
COMPANY_CODE	string(30)	Company Code	<input checked="" type="checkbox"/>	Partition code, segmenting the data.
COMPANY_NAME	string(240)	Company Name	<input checked="" type="checkbox"/>	Name of the partition.
controlCost	double	Control Cost	<input type="checkbox"/>	The total cost of the inventory items to be received. Control Cost is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. The user enters this value manually to confirm the total cost as calculated automatically for the document. If the Control Cost and Total Cost values do not match, the system generates a warning message and the document cannot be saved.
controlQuantity	double	Control Quantity	<input type="checkbox"/>	The manually entered quantity of inventory items. Control Qty. is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. If the Control Qty. and Total Qty. values do not match, the system generates a warning message and the issue cannot be saved.
date	datetime	Date	<input type="checkbox"/>	The date when the receipt was created. All transactions included in this document will have this transaction date.
description	string	Description	<input type="checkbox"/>	A brief description of the inventory issue or its transactions.
errorInfo	string	Error Message	<input type="checkbox"/>	
externalReference	string	External Reference	<input type="checkbox"/>	The external reference number of the inventory issue document (for example, the vendor's reference code).
hold	boolean	Hold	<input type="checkbox"/>	A check box that you select to give the receipt the On Hold status. Clear the check box to save the receipt with the Balanced status.
lastModifiedDateTime	datetime	Last Modified	<input type="checkbox"/>	The date when the document was last modified.
metadata_maxPageSize	int64		<input type="checkbox"/>	
metadata_totalCount	int64	Total Count	<input type="checkbox"/>	
postPeriod	string	Post Period	<input type="checkbox"/>	The financial period to which the transactions recorded in the document should be posted. Format MMYYYY.
referenceNumber	string	Reference Number	<input type="checkbox"/>	The unique reference number of the receipt, which the system

Name	Data Type	Label	Required	Documentation
				automatically assigns according to the numbering sequence selected for receipts on the Inventory Preferences (IN.10.10.00) form.
status	string	Status	<input type="checkbox"/>	The current status of the receipt. The following options are available: On Hold: The receipt/issue is a draft and can be edited. Receipts with this status cannot be released. Balanced: The receipt/issue data has been validated by the system and the receipt can be released. It also can be modified or deleted, but changes can be saved only if the receipt is balanced. Released: The receipt/issue has been released and cannot be edited or deleted.
totalCost	double		<input type="checkbox"/>	The top part > Total cost > The total cost of the inventory items received. The system automatically calculates this value as a sum of all extended cost values of all received inventory items listed in the Transaction Details tab of this form.
totalQuantity	double	Total Quantity	<input type="checkbox"/>	The total quantity of inventory items, which the system calculates automatically, for the document.
transferNumber	string	Transfer Number	<input type="checkbox"/>	The top part > Transfer no. > The transfer number for the receipt operation. (Enter this number only if the two-step transfer operation is performed.)

57.1.1 InventorySummaryByNumber: Visma.net Financials Inventory Summary by Number

Get a range of InventorySummary - ScreenId=IN401000

Catalog: VismaNet

Schema: InventorySummary

Label: Inventory Summary by Number

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invariantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function `InventorySummaryByNumber`. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a ``select * from table(value1, value2, value3)`` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with ``select * from table(name1 => value1, name3 => value3)`` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

58.1.8 InventoryTransferLines: Visma.net Financials Inventory Transfer Lines

Get a range of Inventory Transfers - ScreenId=IN304000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: InventoryTransfer

Label: Inventory Transfer Lines

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryTransferLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
erp-api-background	string	<input type="checkbox"/>		If a URL value is provided, then API endpoint will be queued and executed in background. When the execution of the background operation is finished, the system will POST the response to the specified URL. The endpoint itself responds in this case with a 202-Accepted status and a reference to a state document for the background operation.
greaterThanValue	string	<input type="checkbox"/>		
lastModifiedDateTime	string	<input type="checkbox"/>		
lastModifiedDateTimeCondition	string	<input type="checkbox"/>		
numberToRead	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
orderBy	string	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
pageNumber	int32	<input type="checkbox"/>		Pagination parameter. Page number.
pageSize	int32	<input type="checkbox"/>		Pagination parameter. Number of items to be collected. Please use a page size lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.
skipRecords	int32	<input type="checkbox"/>		This field has been deprecated and will be removed in future versions. Use pageNumber and pageSize for pagination purposes. PageNumber and pageSize does not work with NumberToRead and SkipRecords.
status	string	<input type="checkbox"/>		Waarden: Hold, Balanced, Released.

Columns of Table Function

Label: Journal Transaction Attachments by Period or Date

The data in this table is partitioned per value of the COMPANY_CODE column.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive SQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function JournalTransactionAttachmentsByPeriodOrDateV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch	string	<input type="checkbox"/>		Branch to query data for.
COMPANY_CODE	string	<input type="checkbox"/>		Partition to retrieve data from.
